Project: Oregon City Christian Church Master Plan

Subject: Traffic Impact Study

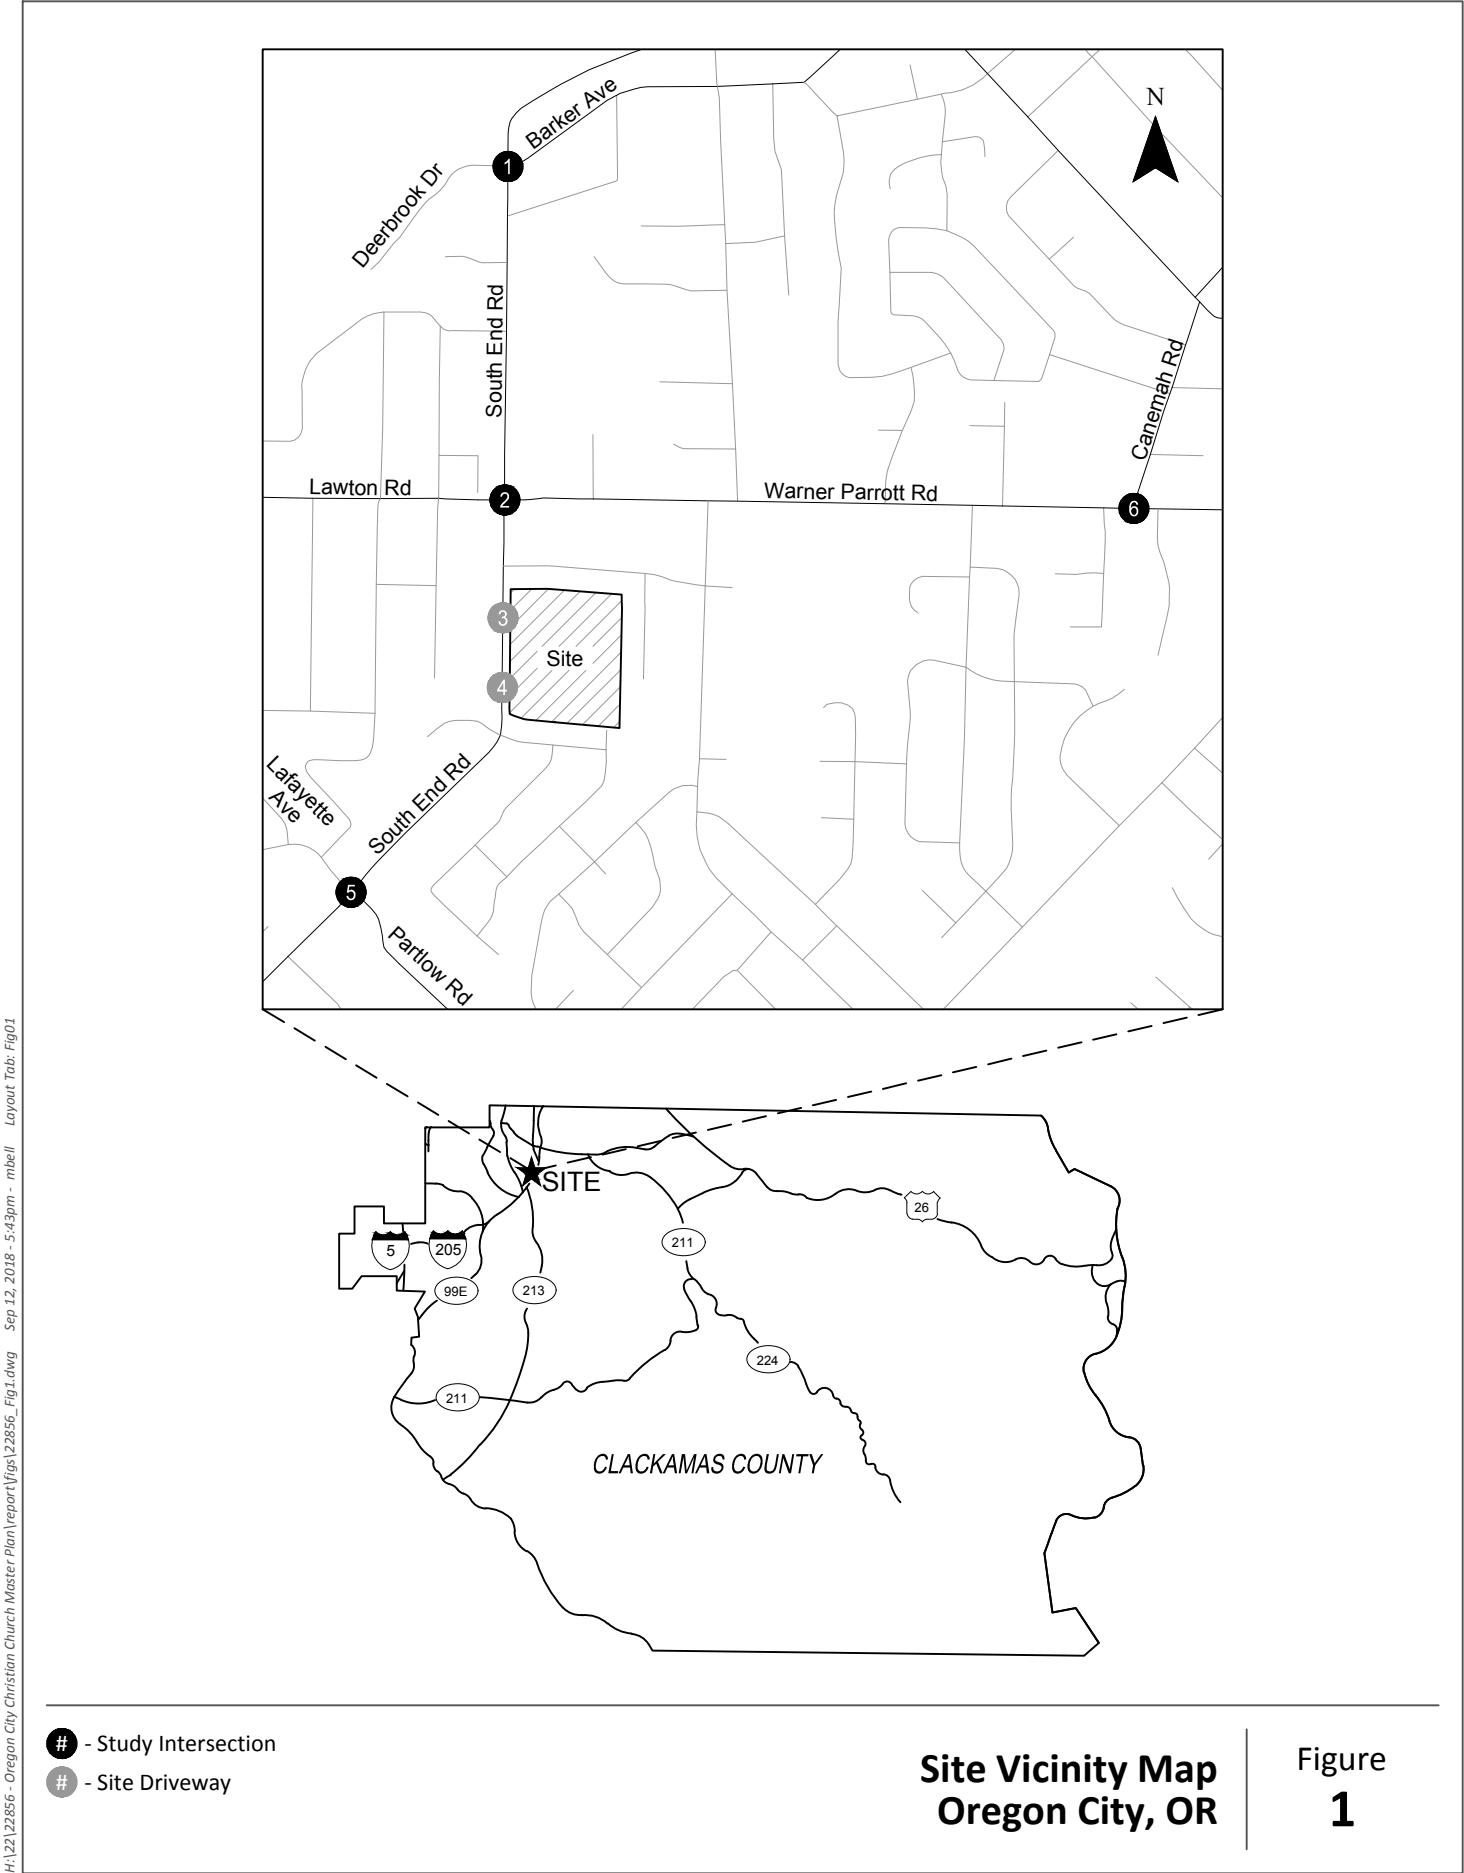

The Oregon City Christian Church recently developed a Master Plan that identifies the vision and long-term goals for future development of the church campus located along the east side of South End Road in Oregon City. Figure 1 illustrates the site vicinity map. The Master Plan includes phased construction of a new recreation center, a new student ministry center, a new administrative building, and renovation of the existing worship center and a new worship center and café. The Master Plan also includes expansion of the existing parking facilities and a new driveway along the southern boundary of the site. Figure 2 illustrates the conceptual master plan. Construction of the new facilities is expected to occur in four phases over a 10-year period as follows:

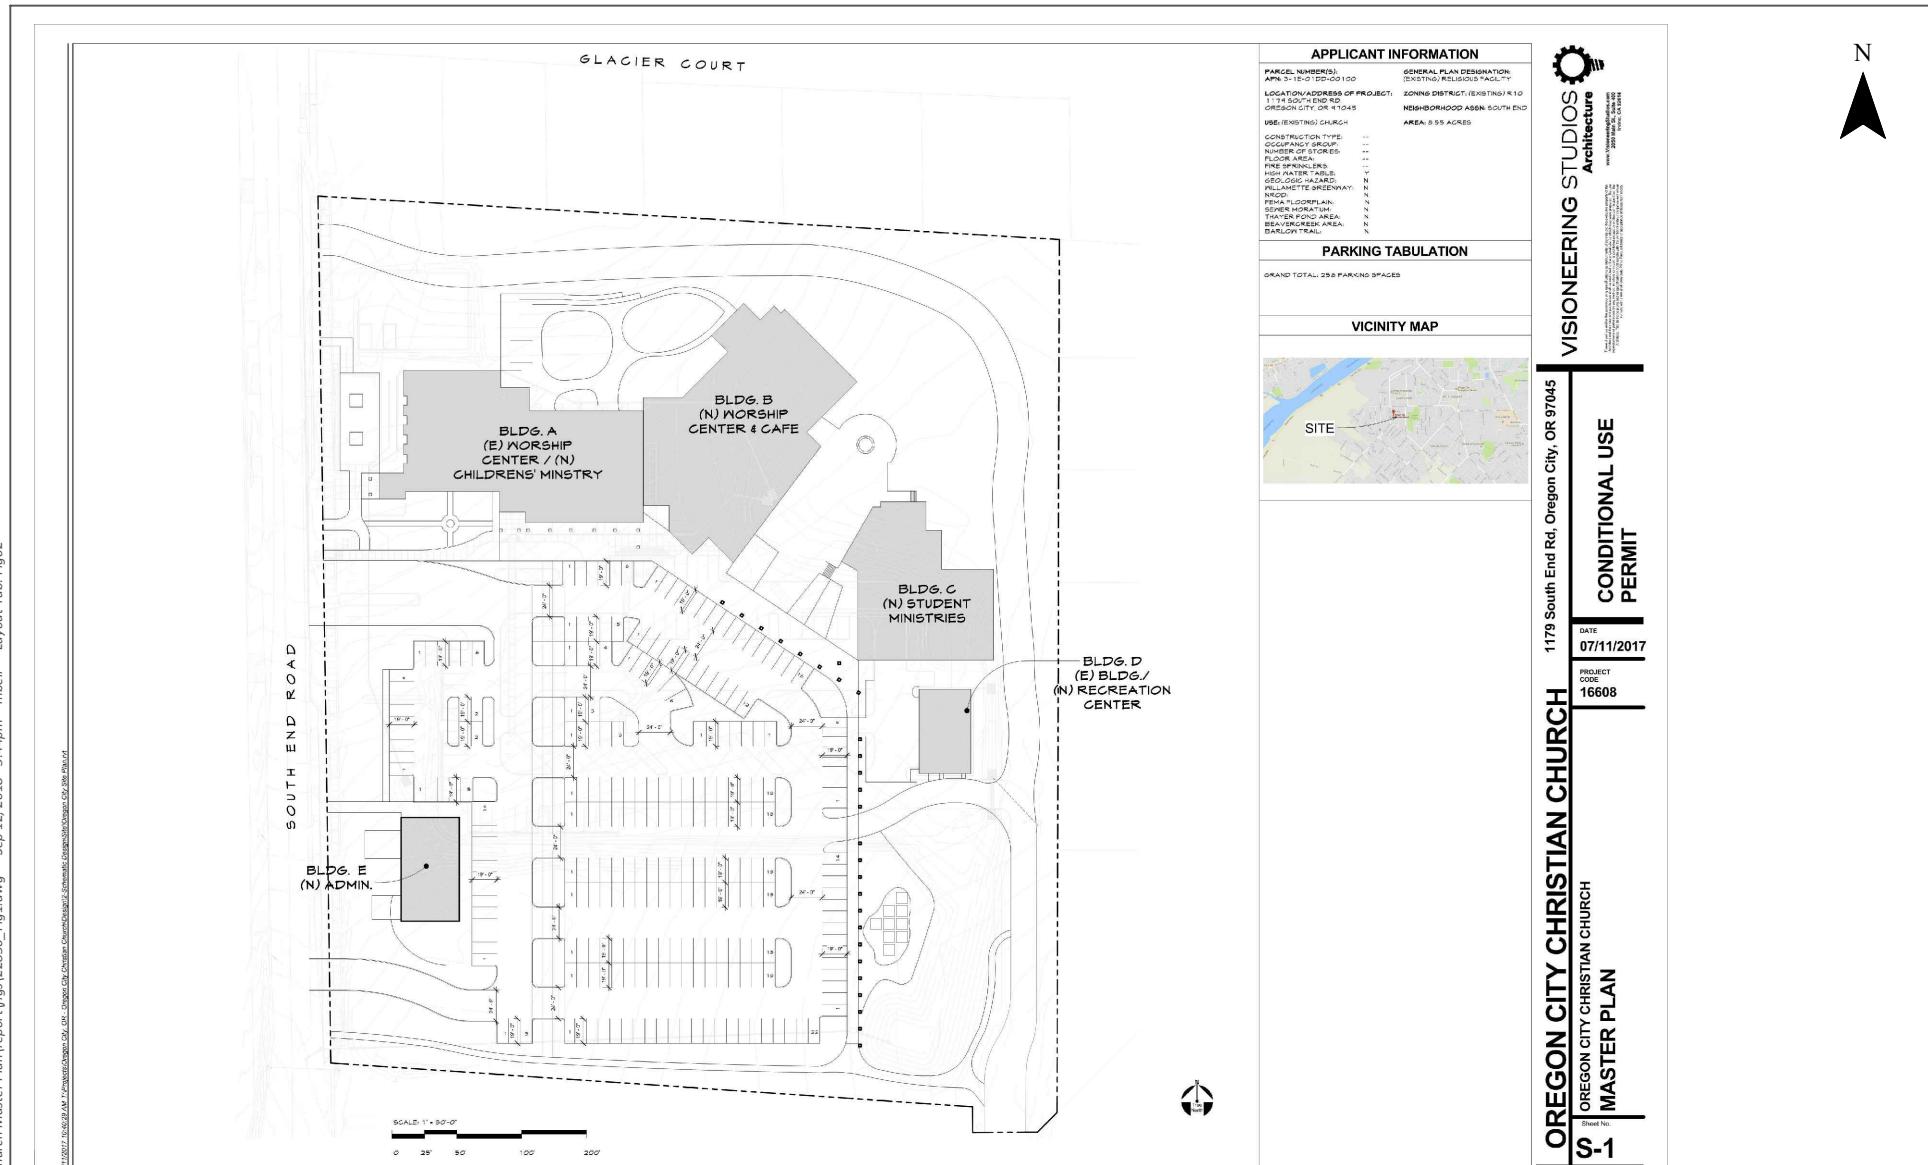

- Phase 1 is expected to occur in 2020 and include a new 8,168 square-foot (sf) recreation center, new parking facilities, and a new driveway along the southern boundary of the site;
- Phase 2 is expected to occur in 2022 and include a new 3,602 sf student ministry center;
- Phase 3 is expected to occur in 2025 and include a new 4,077 sf administrative building; and
- Phase 4 is expected to occur in 2030 and include renovation of the existing worship center and construction of the new worship center and café.
 - The size of the new worship center and café has not been determined; however, the church is planning to accommodate up to 600 parishioners.

The results of this study indicate that the Oregon City Christian Church Master Plan can be developed while maintaining acceptable traffic operations and safety at the study intersections, assuming provision of the following recommended mitigation measures:

- Subject to City direction, the Phase 3 and Phase 4 site development should pay a proportionate share contribution toward future installation of a traffic signal at the South End Road/Warner Parrott Road intersection prior to completion of the two respective development phases. Alternatively, the need for the South End Road/Warner Parrott Road intersection improvements associated with Phase 3 and Phase 4 site development could be re-evaluated prior to the two respective development phases.
- Adequate intersection sight distance should be provided at the site driveways on South End Road in accordance with City of Oregon City standards.

Additional details of the study methodology, findings, and recommendations are provided below.

SCOPE OF THE REPORT

This analysis determines the transportation-related impacts associated with the Oregon City Christian Church Master Plan and was prepared in accordance with the City of Oregon City's Guidelines for Transportation Impact Analyses (TIA Guidelines – Reference 1). The study intersections and scope of this project were selected based on the TIA guidelines and direction provided by City staff. *Appendix "A"* contains the scoping memo prepared for this study. The operational analyses were performed at the following intersections:

1. South End Road/Barker Avenue
2. South End Road/Warner Parrott Road
3. South End Road/Existing Church Driveway (Dwy 1)
4. South End Road/Future Church Driveway (Dwy 2)
5. South End Road/Partlow Road
6. Canemah Road/Warner Parrott Road

This report evaluates these transportation issues:

- Year 2018 existing land-use and transportation-system conditions within the site vicinity during the weekday PM and Sunday mid-day peak periods;
- Planned developments and transportation improvements in the study area;
- Trip generation and distribution estimates for each phase of the Master Plan;
- Year 2020 background traffic conditions (without the Master Plan) during the weekday PM and Sunday mid-day peak periods;
- Year 2020 total traffic conditions (with full build-out and occupancy of Phase 1 of the Master Plan) during the weekday PM and Sunday mid-day peak periods;
- Year 2022 background traffic conditions (with Phase 1 of the Master Plan) during the weekday PM and Sunday mid-day peak periods;
- Year 2022 total traffic conditions (with full build-out and occupancy of Phases 1-2 of the Master Plan) during the weekday PM and Sunday mid-day peak periods;
- Year 2025 background traffic conditions (with Phases 1-2 of the Master Plan) during the weekday PM and Sunday mid-day peak periods;
- Year 2025 total traffic conditions (with full build-out and occupancy of Phases 1-3 of the Master Plan) during the weekday PM and Sunday mid-day peak periods;
- Year 2030 background traffic conditions (with Phases 1-3 of the Master Plan) during the weekday PM and Sunday mid-day peak periods;
- Year 2030 total traffic conditions (with full build-out and occupancy of Phases 1-4 of the Master Plan) during the weekday PM and Sunday mid-day peak periods;
- On-site traffic operations and circulation.

EXISTING CONDITIONS

The existing conditions analysis identifies the site conditions and current physical and operational characteristics of the roadways within the study area. These conditions will be compared with future conditions later in this report. Kittelson & Associates, Inc. (Kittelson) staff visited and inventoried the Oregon City Christian Church campus and study intersections in August 2018. At that time, Kittelson collected information regarding site conditions, adjacent land uses, existing traffic operations, and transportation facilities in the study area.

Site Conditions and Adjacent Land Uses

The Oregon City Christian Church campus currently has a worship center that houses all administrative and other accessory uses to the church. The campus includes a 96-stall parking lot and a maintenance/storage shed. Access to the campus is provided by a single driveway located along the east side of South End Road. A gated emergency access is provided in the southeast corner of the campus that connects to Paulsen Drive¹.

The campus property is currently zoned R-10 (single-family residential), which allows religious institutions as a conditional use. Properties to the north, east, and west are also zoned R-10, while properties to the south are zoned R-8. The majority of adjacent properties have residential land uses consistent with the underlying zoning. The Oregon City United Methodist Church and Clackamas Fire Station 17 are located to the south along the west side of South End Road.

Transportation Facilities

Table 1 summarizes the existing transportation facilities and roadways in the study area.

Table 1: Existing Transportation Facilities and Roadways in the Study Area

Roadway	Functional Classification ¹	Number of Lanes	Posted Speed (mph)	Sidewalks	Bicycle Lanes	On-Street Parking
South End Road	Minor Arterial	2	35	Yes	Yes	Yes
Barker Avenue	Collector	2	25	No	No	No
Warner Parrott Road	Minor Arterial	2	30	Yes	Yes	Yes
S Partlow Road	Collector	2	25	Yes	Yes	No
Canemah Road	Collector	2	25	No	No	No

1. Per the Oregon City Transportation System Plan (TSP – Reference 2).

¹ Prior conditional use approval related to the gated access allows for use associated with church activities but is subject to a monitoring condition. In the event the church proposes to use the emergency access before and after worship services in the future, the church should coordinate with City staff to confirm the nature and extent of monitoring necessary to evaluate potential impacts to the adjacent neighborhood as well as other pertinent requirements, if any.

Roadway Facilities

South End Road borders the church campus to the west and connects the campus to several major roadways, including Warner Parrott Road, Barker Avenue, and OR 99E via S 2nd Avenue to the north and Partlow Road and OR 99E to the south. Warner Parrott Road also connects the campus to several major roadways, including Canemah Road, Linn Avenue, Leland Road, and Warner Milne Road to the east. Figure 3 illustrates the existing lane configurations and traffic control devices at the study intersections.

Pedestrian and Bicycle Facilities

Sidewalks and on-street bike lanes are currently provided along both sides of South End Road, Warner Parrott Road, and Partlow Road; however, there are several gaps in the sidewalk and bike lane networks. Continuous sidewalks with planted landscape buffers are provided along South End Road adjacent to the campus. The sidewalks appear to be in good shape and of appropriate width per Oregon City standards.

Transit Facilities

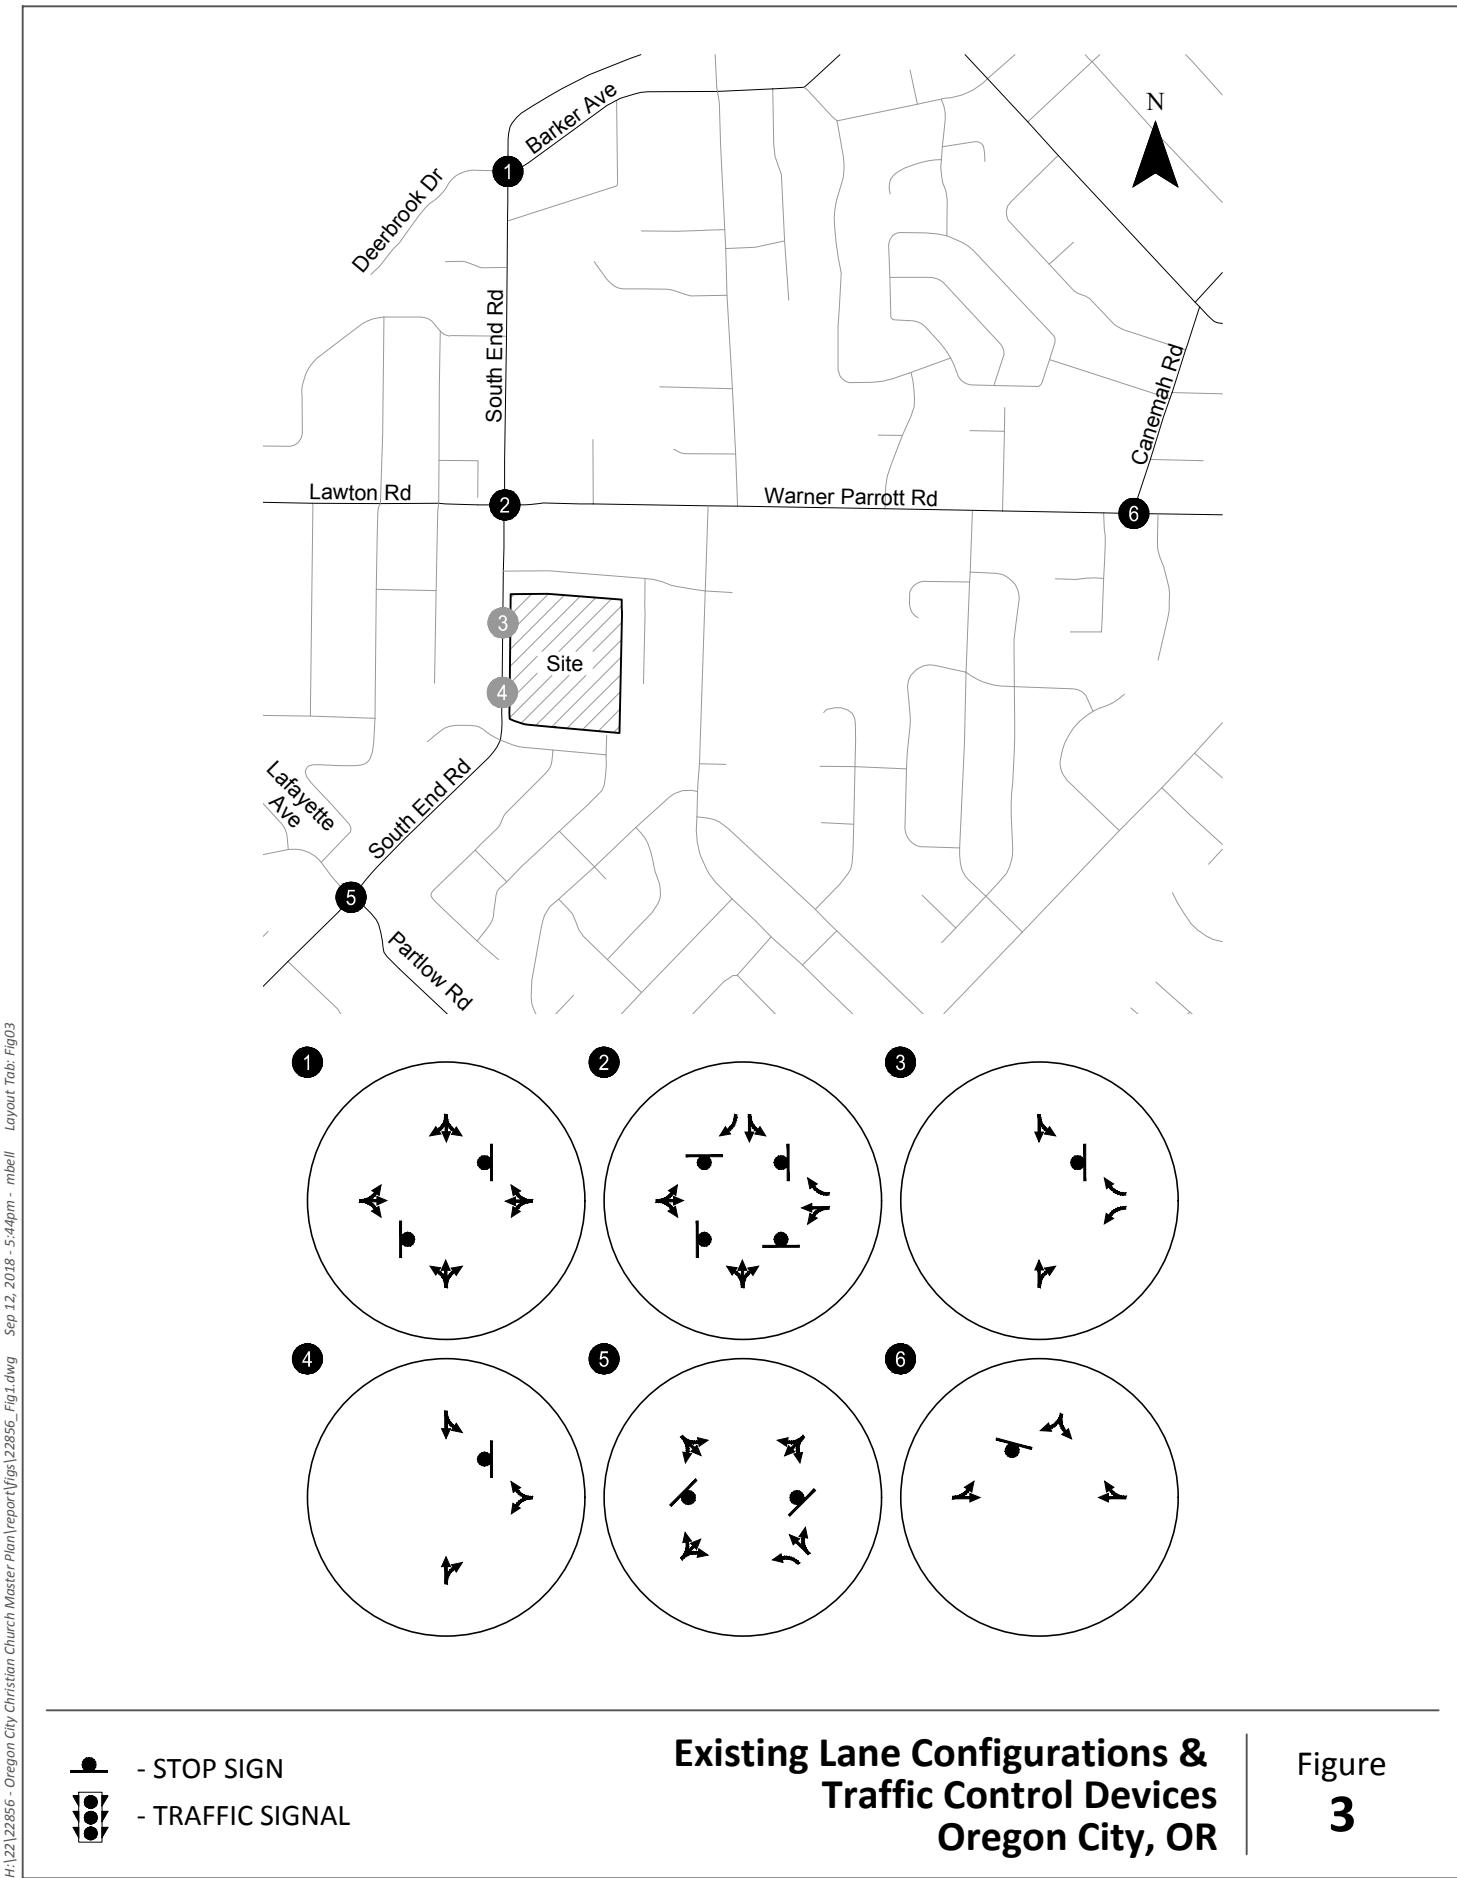

Local transit service is not provided in the study area. The closest transit service is provided to the east along Linn Avenue and Warner Milne Road. TriMet Bus Line 33 provides frequent service between Clackamas Town Center and Clackamas Community College Monday through Friday from 5:00 AM to 2:00 AM and from 6:00 AM to 2:00 AM Saturdays and Sundays. Trimet's Southeast Service Enhancement Plan identifies the area surrounding the campus as a Community/Jobs Connector Service Area and plans to provide future shuttle service to the area (TriMet – Reference 3).

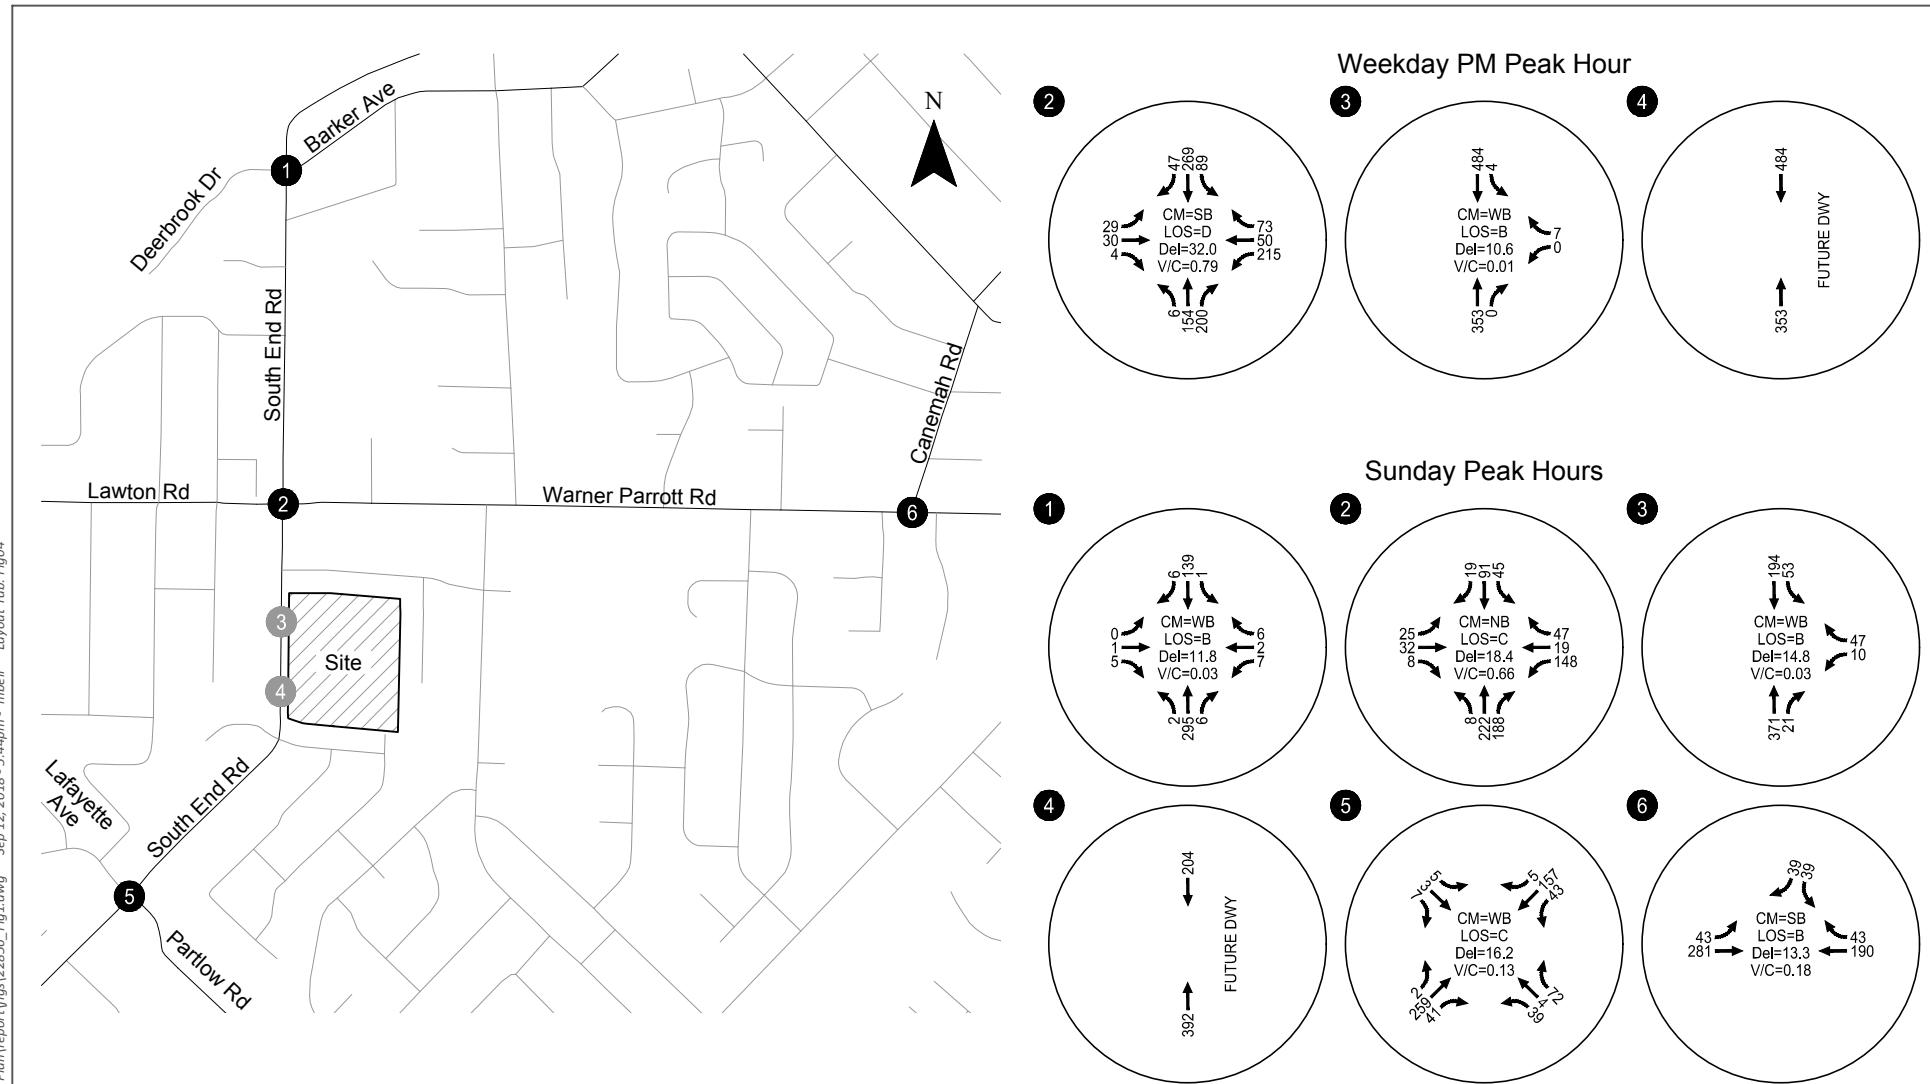

Traffic Volumes and Peak Hour Operations

Turning movement counts were conducted at the study intersections in August 2018. The counts were conducted at the South End Road/Warner Parrott Road intersection and the site driveway on a typical mid-week day during the evening (4:00 to 6:00 PM) peak time period and at all study intersections on a typical Sunday morning (8:00 AM to 12:00 PM). The system-wide weekday PM and Sunday peak hours were found to occur from 5:00 to 6:00 PM and 10:15 to 11:15 AM, respectively. Figure 4 summarizes the year 2018 existing turning-movement counts at the study intersection for the weekday PM and Sunday peak hours. Appendix "B" contains the traffic count worksheets used in this study.

Current Levels of Service

All level-of-service analyses described in this report were performed in accordance with the procedures stated in the *Highway Capacity Manual* (HCM – Reference 4). A *description of level of service and the criteria by which they are determined is presented in Appendix "C"*. Appendix "C" also indicates how level of service is measured and what is generally considered an acceptable range.

CM = CRITICAL MOVEMENT (UNSIGNALIZED)
 LOS = INTERSECTION AVERAGE LEVEL OF SERVICE (SIGNALIZED)/
 CRITICAL MOVEMENT LEVEL OF SERVICE (UNSIGNALIZED)
 Del = INTERSECTION AVERAGE CONTROL DELAY (SIGNALIZED)/
 CRITICAL MOVEMENT CONTROL DELAY (UNSIGNALIZED)
 V/C = VOLUME-TO-CAPACITY RATIO

**Year 2018 Existing Traffic Conditions
 Weekday PM and Sunday Peak Hours
 Oregon City, OR**

Figure
4

Per the TIA Guidelines, Oregon City requires all signalized intersections located outside the Regional Center to operate at Level of Service (LOS) "D" or better for the intersection as a whole and no approach operating at worse than LOS "E" and a v/c ratio higher than 1.0 for the sum of critical movements. Oregon City requires all unsignalized intersection to operate at LOS "E" or better for the poorest operating approach and with no movement serving more than 20 peak hour vehicles operating worse than LOS "E". Therefore, LOS "F" is tolerated for minor movements during the peak hour.

All intersection level-of-service analyses used the peak 15-minute flow rates that occur during the weekday PM and Sunday mid-day peak hours. Using the peak 15-minute flow rates ensures that this analysis is based on a reasonable worst-case scenario. For this reason, the analysis reflects conditions that are only likely to occur for 15 minutes out of each average peak hour.

Figure 4 summarizes the year 2018 existing traffic conditions at the study intersections during the weekday PM and Sunday peak hours. As shown, all of the study intersections currently operate acceptably per their applicable mobility standards. *Appendix "D" includes the year 2018 existing traffic conditions worksheets.*

Traffic Safety

The crash history of the study intersections was reviewed in an effort to identify potential safety issues in the study area. The Oregon Department of Transportation (ODOT) provided the five most recent years of crash data available for the study intersections, which includes the period from January 1, 2012, through December 31, 2016. Table 2 summarizes the crash data over the five-year period.

Table 2: Intersection Crash History (January 1, 2012 through December 31, 2016)

Intersection	Crash Type					Crash Severity			Total	Crash Rates (Crashes /MEV)	ODOT 90 th Percentile Rate
	Rear-End	Turn	Angle	Ped/Bike	Other	PDO ¹	Injury	Fatality			
South End Road/Barker Avenue	-	-	-	-	-	0	0	-	0	0.00	0.408
South End Road/Warner Parrott Road	2	2	4	-	-	6	2	-	8	0.376	0.408
South End Road/S Partlow Road	1	2	-	-	-	2	1	-	3	0.258	0.408
Canemah Road/Warner Parrott Road	3	1	-	-	-	1	3	-	4	0.345	0.293

Source: ODOT

MEV=Million Entering Vehicles

The crash rates shown in Table 2 were compared to the 90th percentile rates for similar facilities shown in Table 4-1 of the ODOT Analysis Procedures Manual (APM). Per the APM, any intersection that has a crash rate equal to or greater than the corresponding 90th percentile rate is considered a high-risk intersection and is recommended for further review. Based on these criteria, no intersection is recommended for further crash pattern review. *Appendix "E" contains the crash data provided by ODOT.*

TRANSPORTATION IMPACT ANALYSIS

The transportation impact analysis identifies how the study area's transportation system will operate in the year each phase of the Master Plan is expected to be fully built. The impact of traffic generated by each phase of the Master Plan was examined as follows:

- Planned developments and transportation improvements in the site vicinity were identified.
- Background traffic conditions (with and without the Master Plan) were analyzed at the study intersections during the weekday PM and Sunday peak hours.
 - Background conditions were developed by applying a 1.9-percent annual growth rate to the existing traffic volumes to account for regional growth in the site vicinity.
- Site-generated trips were estimated for build-out of each phase of the Master Plan.
- Site trip-distribution patterns were identified and used to assign the site-generated trips to the study intersections.
- Total traffic conditions (with full build-out and occupancy of the Master Plan) were analyzed at the study intersections and site-access driveways during the weekday PM and Sunday peak hours.
- On-site circulation issues and site-access operations were evaluated.

YEAR 2020 BACKGROUND TRAFFIC CONDITIONS

The year 2020 background traffic conditions analysis identifies how the study area's transportation system will operate in the year Phase 1 of the Master Plan is expected to be fully built, 2020. This analysis includes traffic attributed to planned developments within the study area and to general growth in the region but does not include traffic from Phase 1 of the Master Plan.

Planned Developments and Transportation Improvements

Kittelson identified and reviewed the planned developments and transportation improvements within the study area. Based on discussions with City staff, there are no approved developments within the study area that impact the study intersections; however, there are two transportation projects identified in the TSP that could. Both projects are identified on the "likely to be funded" project list as medium-term priority. Projects identified as medium-term priority are recommended for implementation within 5 to 10 years of adoption of the TSP (2013). The projects include:

- Project D32: South End Road/Warner Parrott Road Operational Enhancement – Install a traffic signal with dedicated left-turn lanes for the South End Road approaches to Warner Parrott Road.
- Project D33: South End Road/Lafayette Avenue-Partlow Road Operational Enhancement – Install a single-lane roundabout.

Traffic Volumes

The growth rate used in this analysis was determined based on a review of historic traffic volumes provided in the TSP and direction provided by City staff. The TSP shows an increase of approximately 1.90 percent per year at several intersections within the south part of the City. Therefore, the year 2020 background traffic volumes were developed by applying a 3.8 percent growth rate (1.90 percent per year for two years) to the existing traffic volumes shown in Figure 4. Figure 5 illustrates the resulting forecast year 2020 background traffic volumes at the study intersection during the weekday PM and Sunday peak hours.

Level-of-Service Analysis

Figure 5 summarizes the year 2020 background traffic conditions at the study intersections during the weekday PM and Sunday peak hours. As shown, all of the study intersections are forecast to operate acceptably per their applicable mobility standards. *Appendix "F" includes the year 2020 background traffic conditions worksheets.*

PHASE 1 DEVELOPMENT PLAN

Phase 1 of the Master Plan includes construction of a new 8,168 sf recreation center, new parking facilities, and a new driveway along the southern boundary of the site. The new parking facilities will increase the parking supply from 96 stalls to 258 total stalls; the additional stalls will accommodate full build-out of the Master Plan. The new driveway will connect with South End Road approximately 400-feet south of the existing driveway. Full build-out and occupancy of Phase 1 is expected to occur in 2020.

Trip Generation

Trip generation estimates were prepared for Phase 1 of the Master Plan based on a trip generation study conducted at the church in July 2018. *Appendix "A" contains additional information related to the trip generation study.* Table 3 summarizes the daily, weekday PM, Sunday, and Sunday peak hour trips associated with Phase 1 of the Master Plan.

Table 3: Phase 1 Trip Generation

Phase	Size	Daily Trips (Weekday)	Weekday PM Peak Hour of Adjacent Street			Daily Trips (Sunday)	Sunday Peak Hour of Generator		
			Total	In	Out		Total	In	Out
1	8,168 sf	64	6	3	3	222	72	32	40

Site Trip Distribution/Trip Assignment

A trip distribution pattern was developed for the Master Plan based on existing traffic patterns and the location of major trip origins and destinations in the Oregon City area. Figure 6 illustrates the estimated trip distribution pattern.

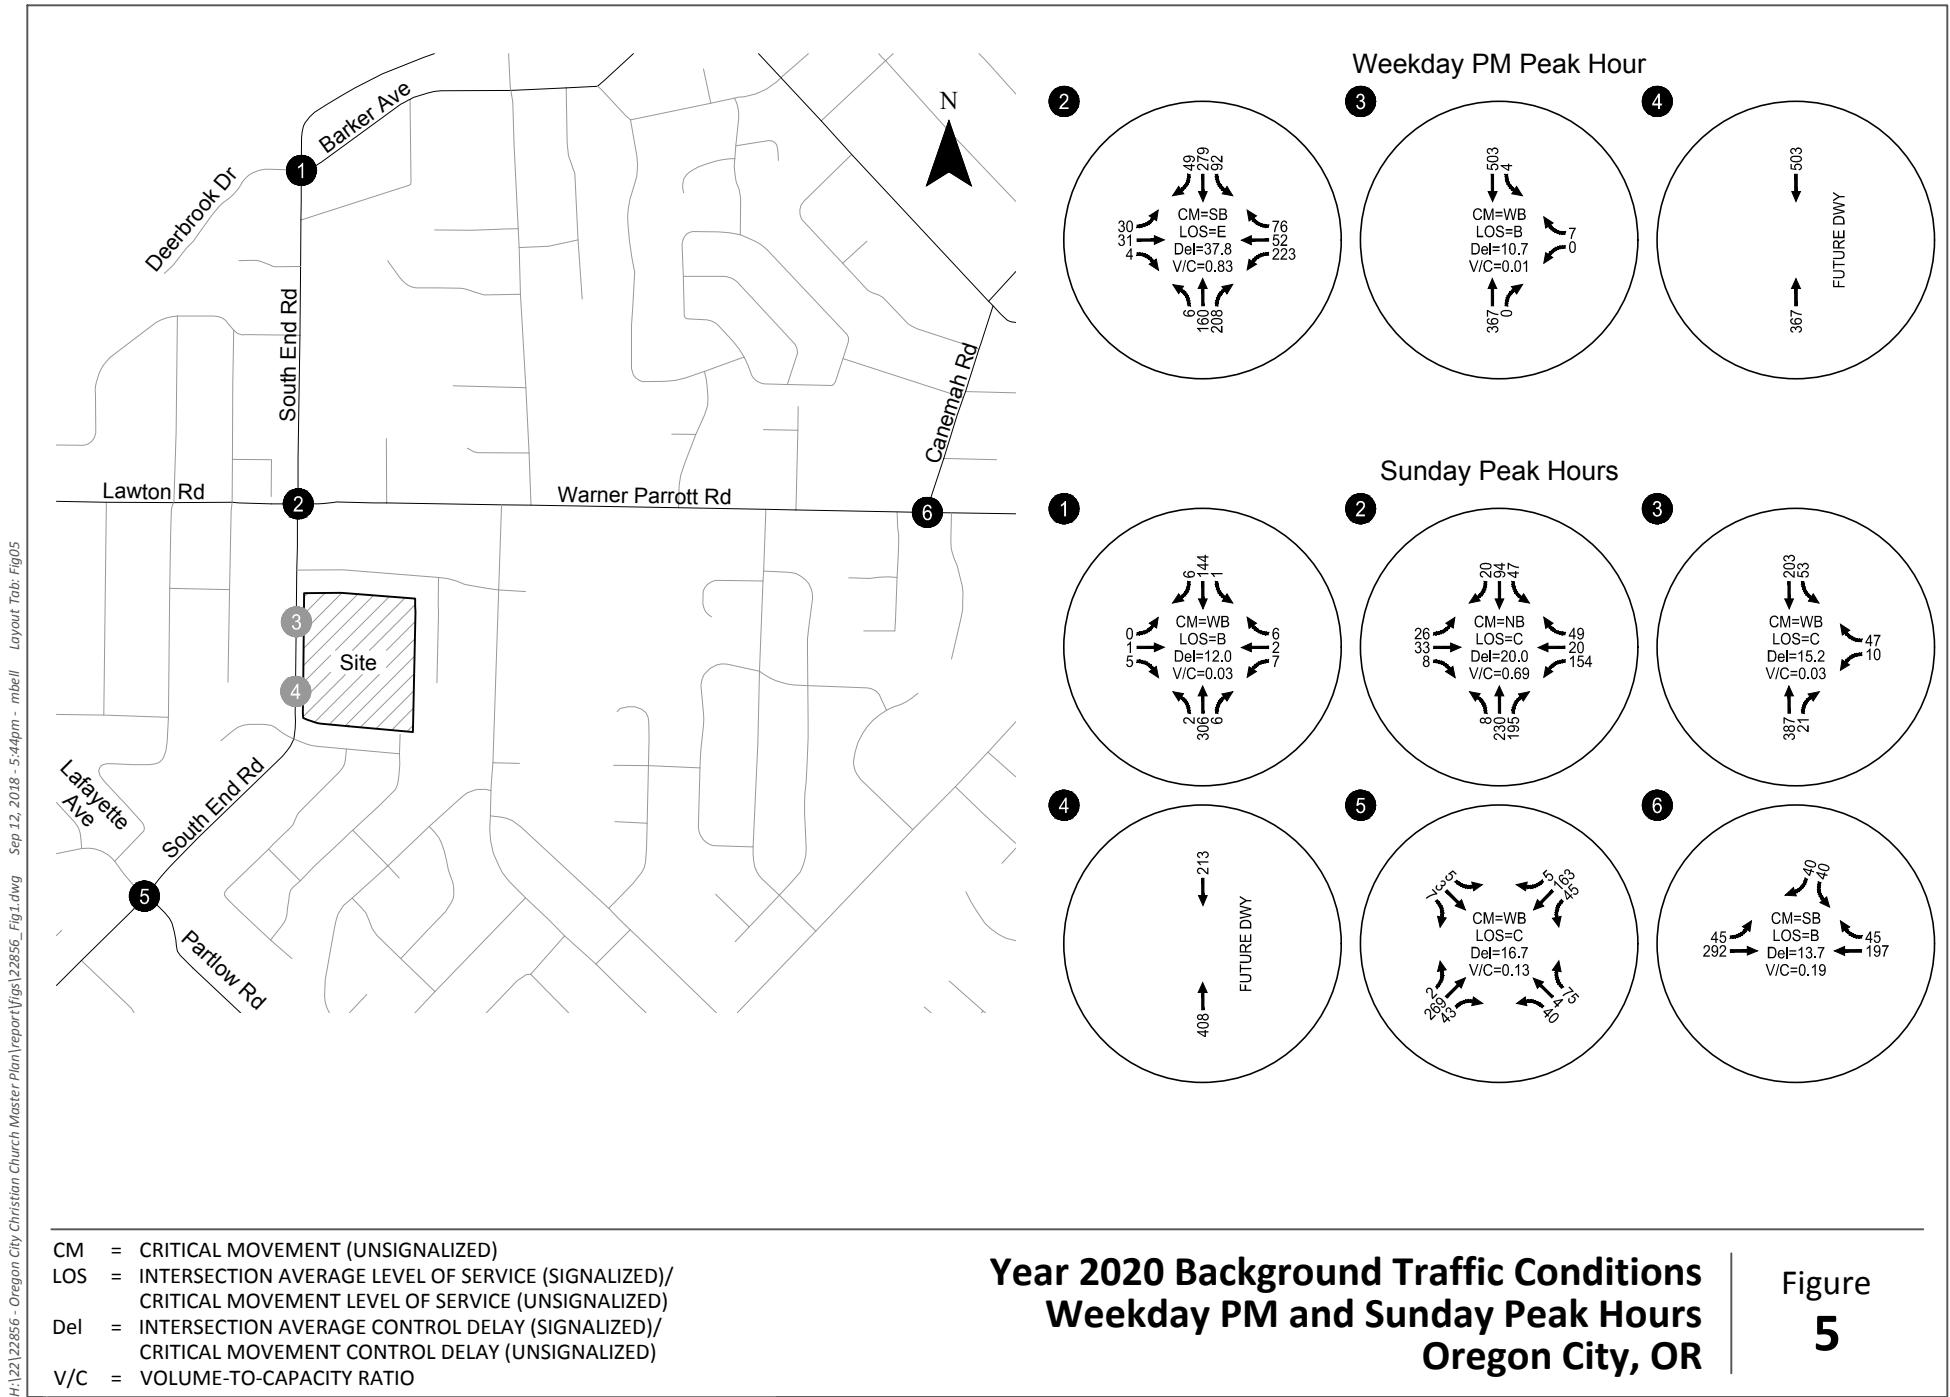

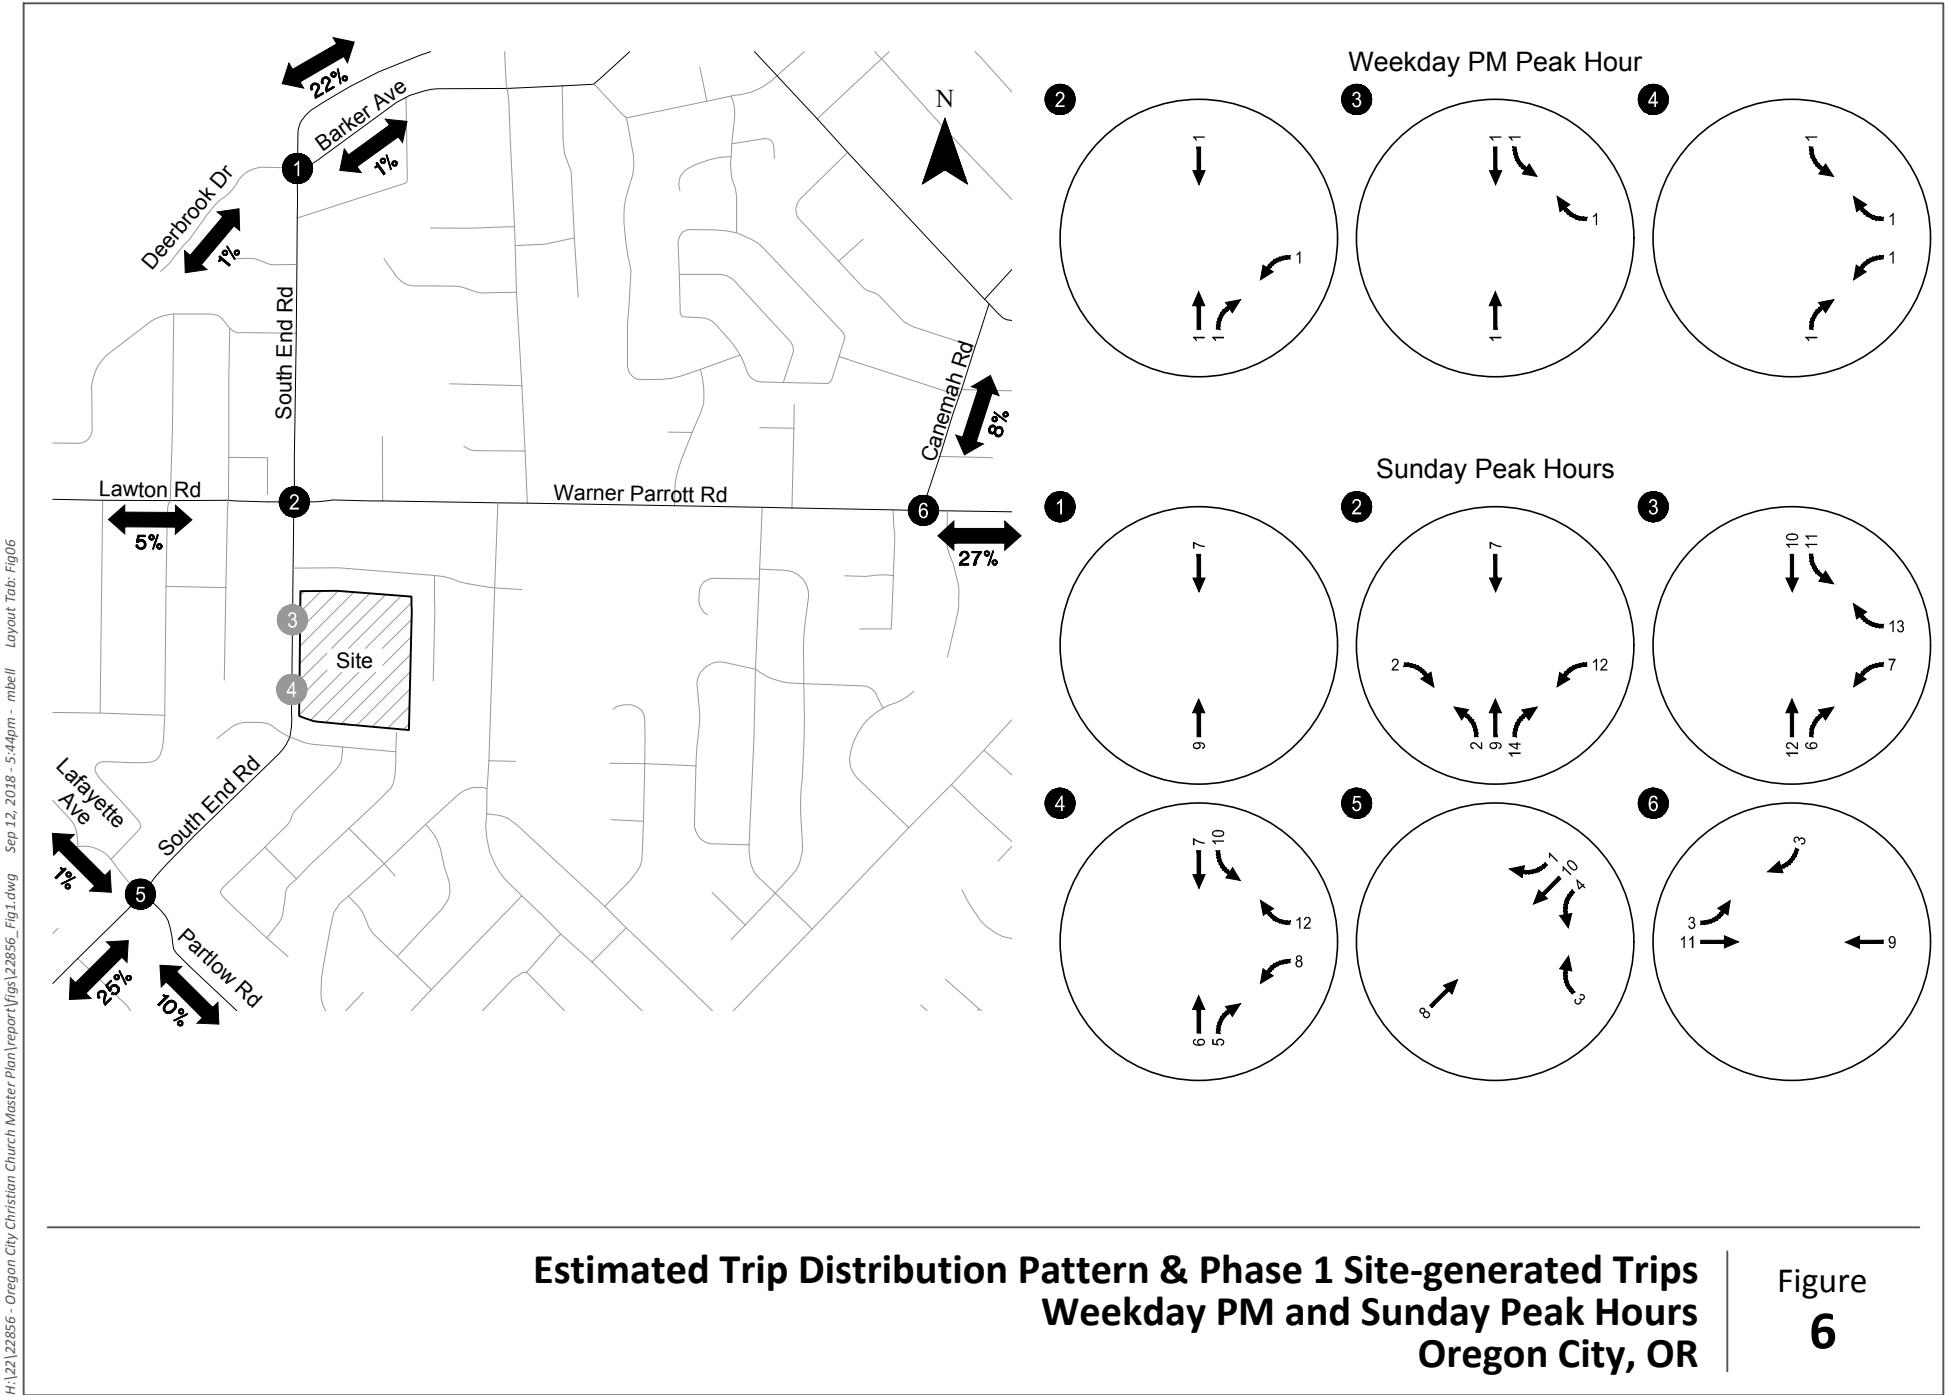

Figure
5

The site-generated trips shown in Table 3 were distributed to the study area roadways according to the trip distribution pattern shown in Figure 6. Figure 6 also illustrates the assignment of site-generated trips at the study intersections during the weekday PM and Sunday peak hours.

YEAR 2020 TOTAL TRAFFIC CONDITIONS

The total traffic conditions analysis forecasts how the study area's transportation system will operate with traffic generated by Phase 1 of the Master Plan. The year 2020 background traffic volumes shown in Figure 5 were added to the site-generated trips shown in Figure 6 to arrive at the total traffic volumes shown in Figure 7.

Intersection Level of Service

Figure 7 summarizes the year 2020 Phase 1 total traffic conditions analysis results at the study intersections during the weekday PM and Sunday peak hours. As shown, all of the study intersections and site driveways are forecast to operate acceptably per their applicable mobility standards. *Appendix "G" includes the year 2020 total traffic conditions worksheets.*

YEAR 2022 BACKGROUND TRAFFIC CONDITIONS

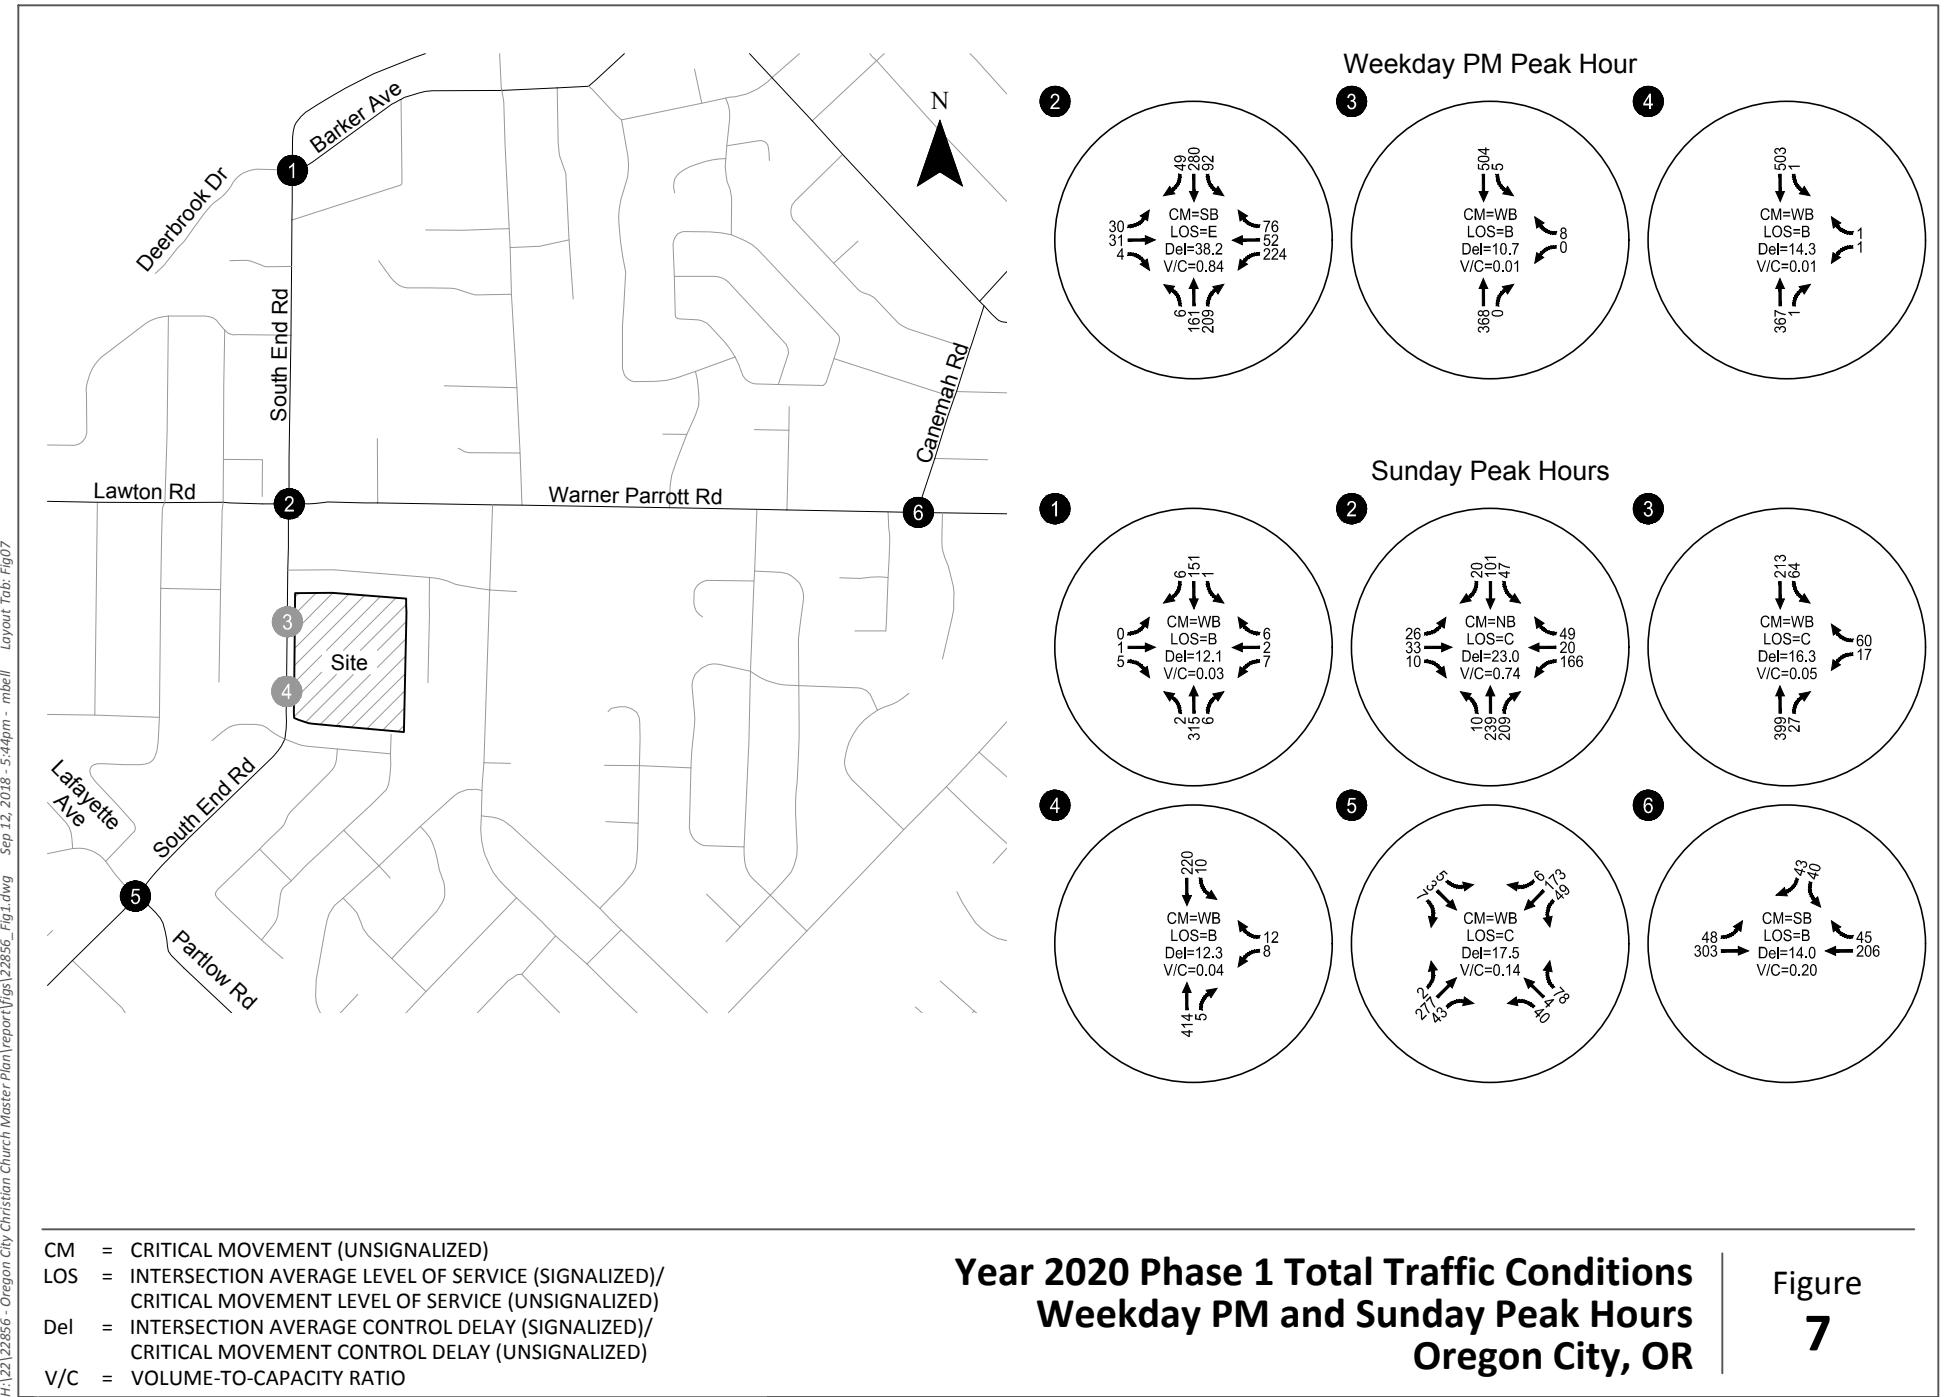

The year 2022 background traffic conditions analysis identifies how the study area's transportation system will operate in the year Phase 2 of the Master Plan is expected to be fully built, 2022. This analysis includes traffic attributed to Phase 1 of the Master Plan and to general growth in the region but does not include traffic from Phase 2 of the Master Plan.

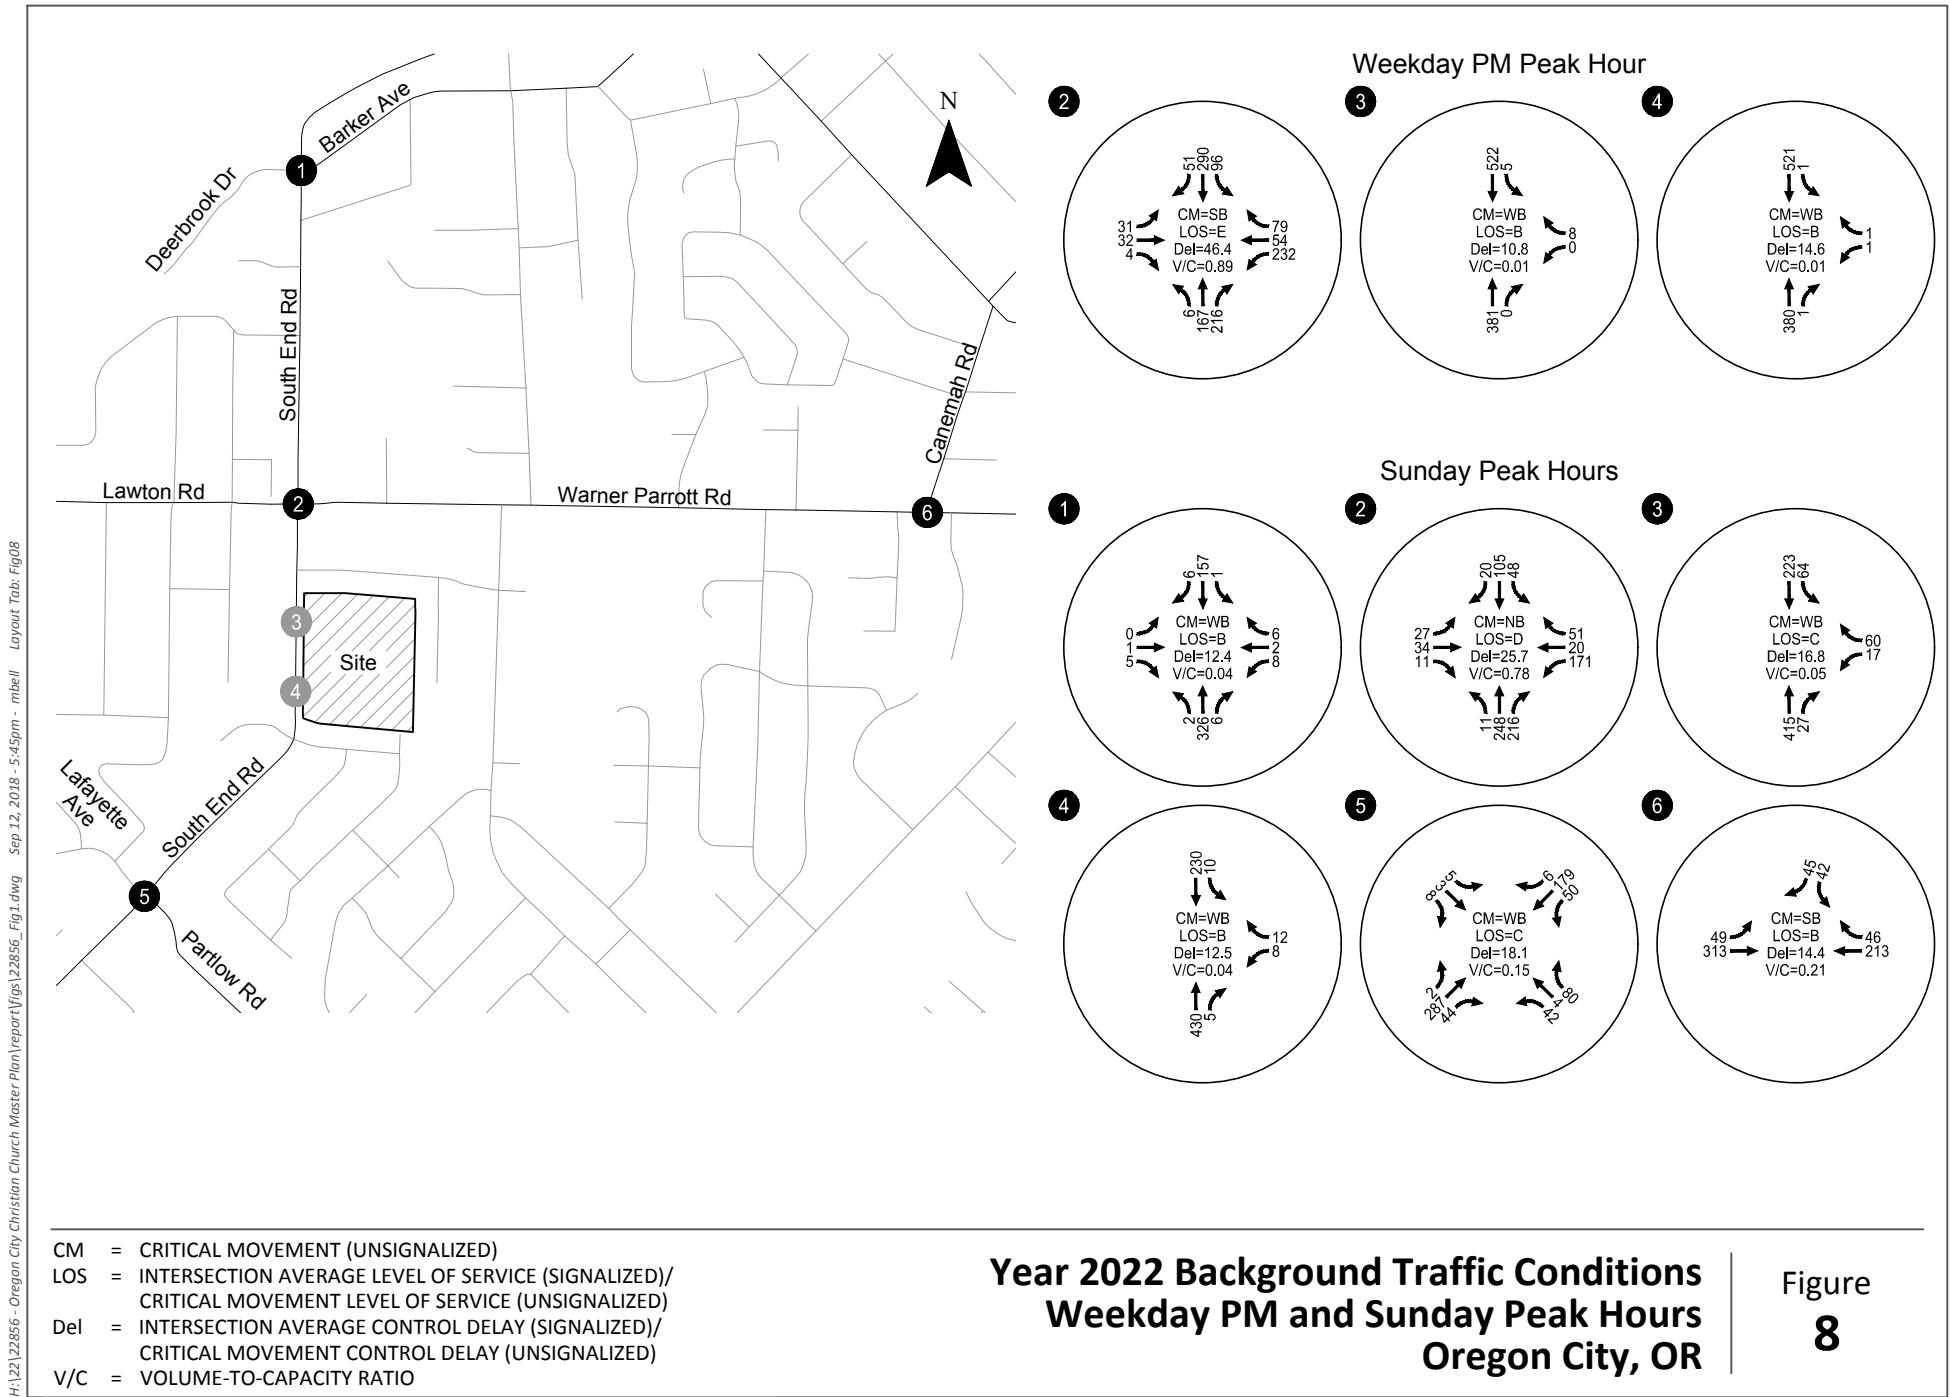

Traffic Volumes

The year 2022 background traffic volumes were developed by applying a 7.6 percent growth rate (1.90 percent per year for four years) to the existing traffic volumes shown in Figure 4 and by adding the Phase 1 site-generated trips shown in Figure 6. Figure 8 illustrates the resulting forecast year 2022 background traffic volumes at the study intersection during the weekday PM and Sunday peak hours.

Level-of-Service Analysis

Figure 8 summarizes the year 2022 background traffic conditions at the study intersections during the weekday PM and Sunday mid-day peak hours. As shown, all of the study intersections are forecast to operate acceptably per their applicable mobility standards. *Appendix "H" includes the year 2022 background traffic conditions worksheets.*

PHASE 2 DEVELOPMENT PLAN

Phase 2 of the Master Plan includes construction of a new 3,602 sf student ministry center. Full build-out and occupancy of Phase 2 is expected to occur in 2022.

Trip Generation

Trip generation estimates were prepared for Phase 2 of the Master Plan based on a trip generation study conducted at the church in July 2018. *Appendix "A" contains additional information related to the trip generation study.* Table 4 summarizes the daily, weekday PM, Sunday, and Sunday peak hour trips associated with Phase 2 of the Master Plan.

Table 4: Phase 2 Trip Generation

Phase	Size	Daily Trips (Weekday)	Weekday PM Peak Hour of Adjacent Street			Daily Trips (Sunday)	Sunday Peak Hour of Generator		
			Total	In	Out		Total	In	Out
2	3,602 sf	28	2	1	1	98	32	14	18

Site Trip Distribution/Trip Assignment

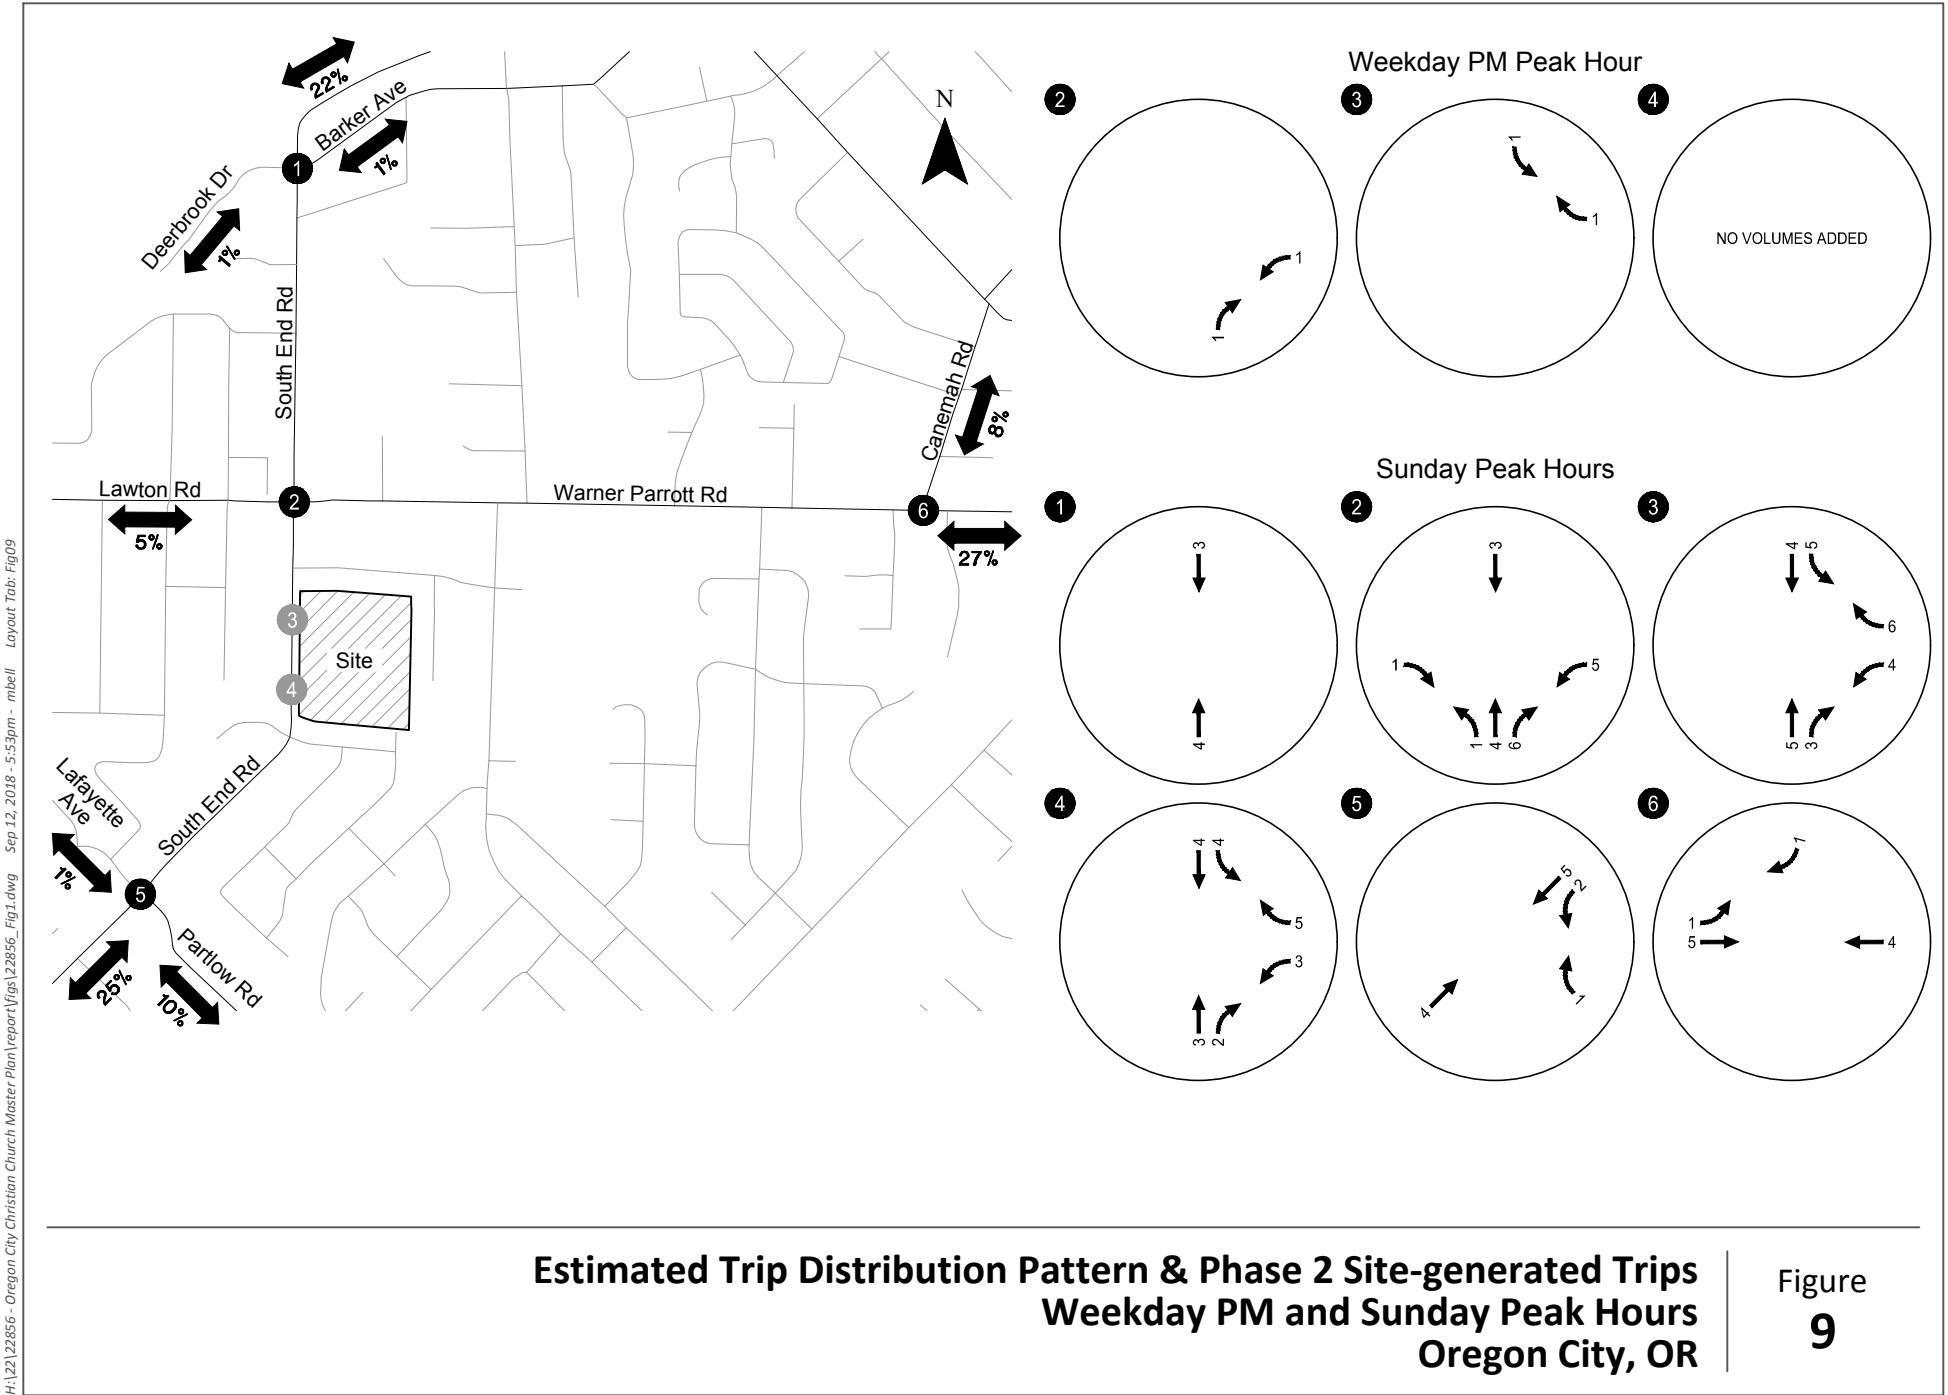

The site-generated trips shown in Table 4 were distributed to the study area roadways according to the trip distribution pattern shown in Figure 9. Figure 9 also illustrates the assignment of Phase 2 site-generated trips at the study intersections during the weekday PM and Sunday peak hours.

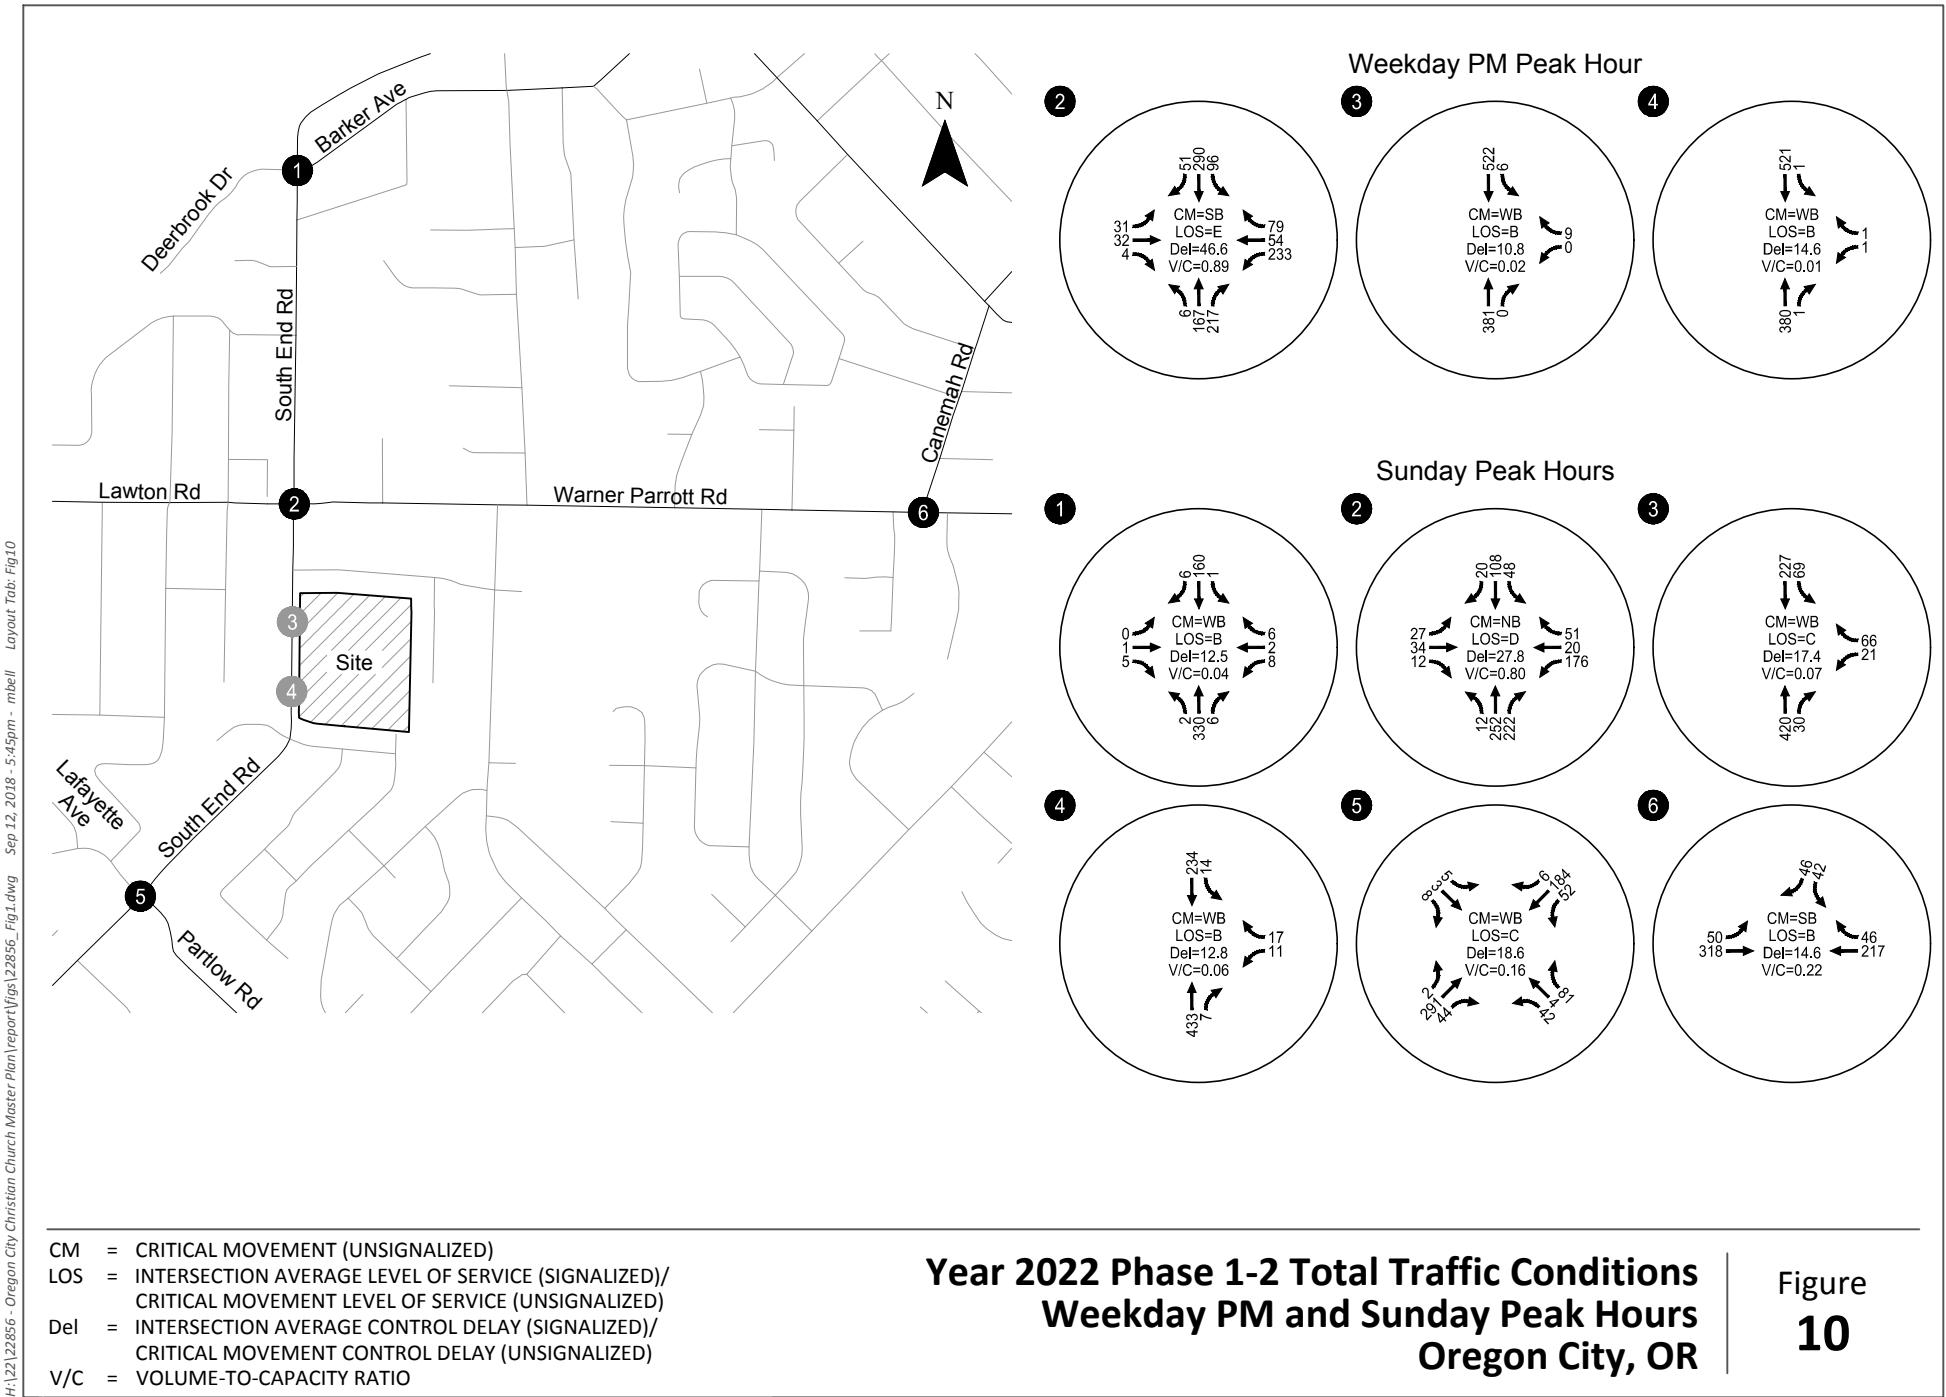

YEAR 2022 TOTAL TRAFFIC CONDITIONS

The total traffic conditions analysis forecasts how the study area's transportation system will operate with traffic generated by Phases 1-2 of the Master Plan. The year 2022 background traffic volumes shown in Figure 8 were added to the site-generated trips shown in Figure 9 to arrive at the total traffic volumes shown in Figure 10.

Intersection Level of Service

Figure 10 summarizes the year 2022 Phases 1-2 total traffic conditions analysis results at the study intersections during the weekday PM and Sunday peak hours. As shown, all of the study intersections and site driveways are forecast to operate acceptably per their applicable mobility standards. *Appendix "I" includes the year 2022 total traffic conditions worksheets.*

YEAR 2025 BACKGROUND TRAFFIC CONDITIONS

The year 2025 background traffic conditions analysis identifies how the study area's transportation system will operate in the year Phase 3 of the Master Plan is expected to be fully built, 2025. This analysis includes traffic attributed to Phases 1-2 of the Master Plan and to general growth in the region but does not include traffic from Phase 3 of the Master Plan.

Traffic Volumes

The year 2025 background traffic volumes were developed by applying a 13.3 percent growth rate (1.90 percent per year for seven years) to the existing traffic volumes shown in Figure 4 and by adding the Phase 1 site-generated trips shown in Figure 6 and the Phase 2 site-generated trips shown in Figure 9. Figure 11 illustrates the resulting forecast year 2025 background traffic volumes at the study intersection during the weekday PM and Sunday peak hours.

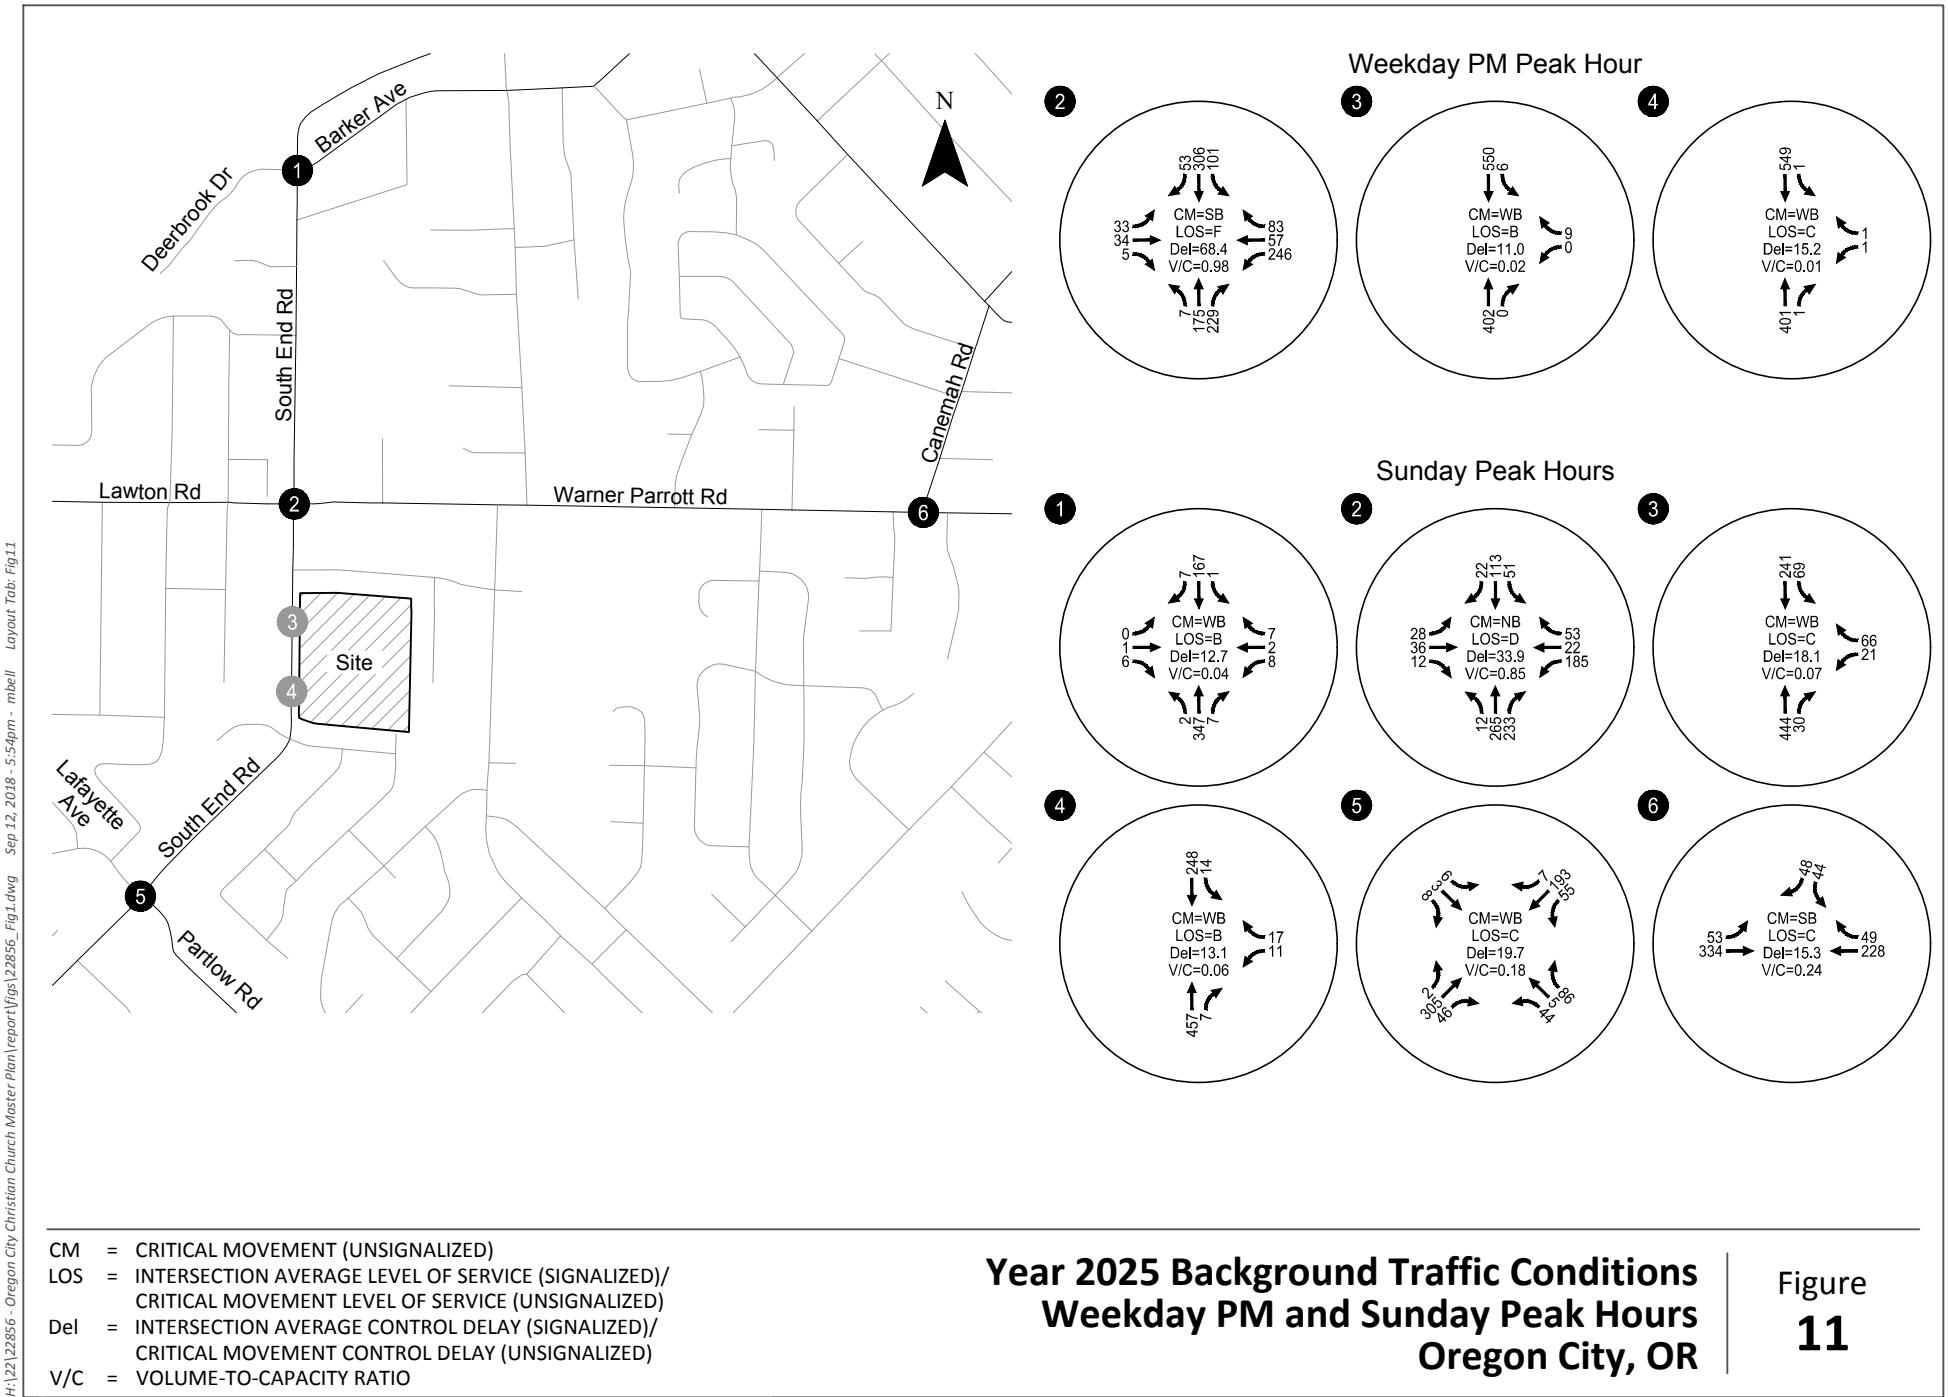

Level-of-Service Analysis

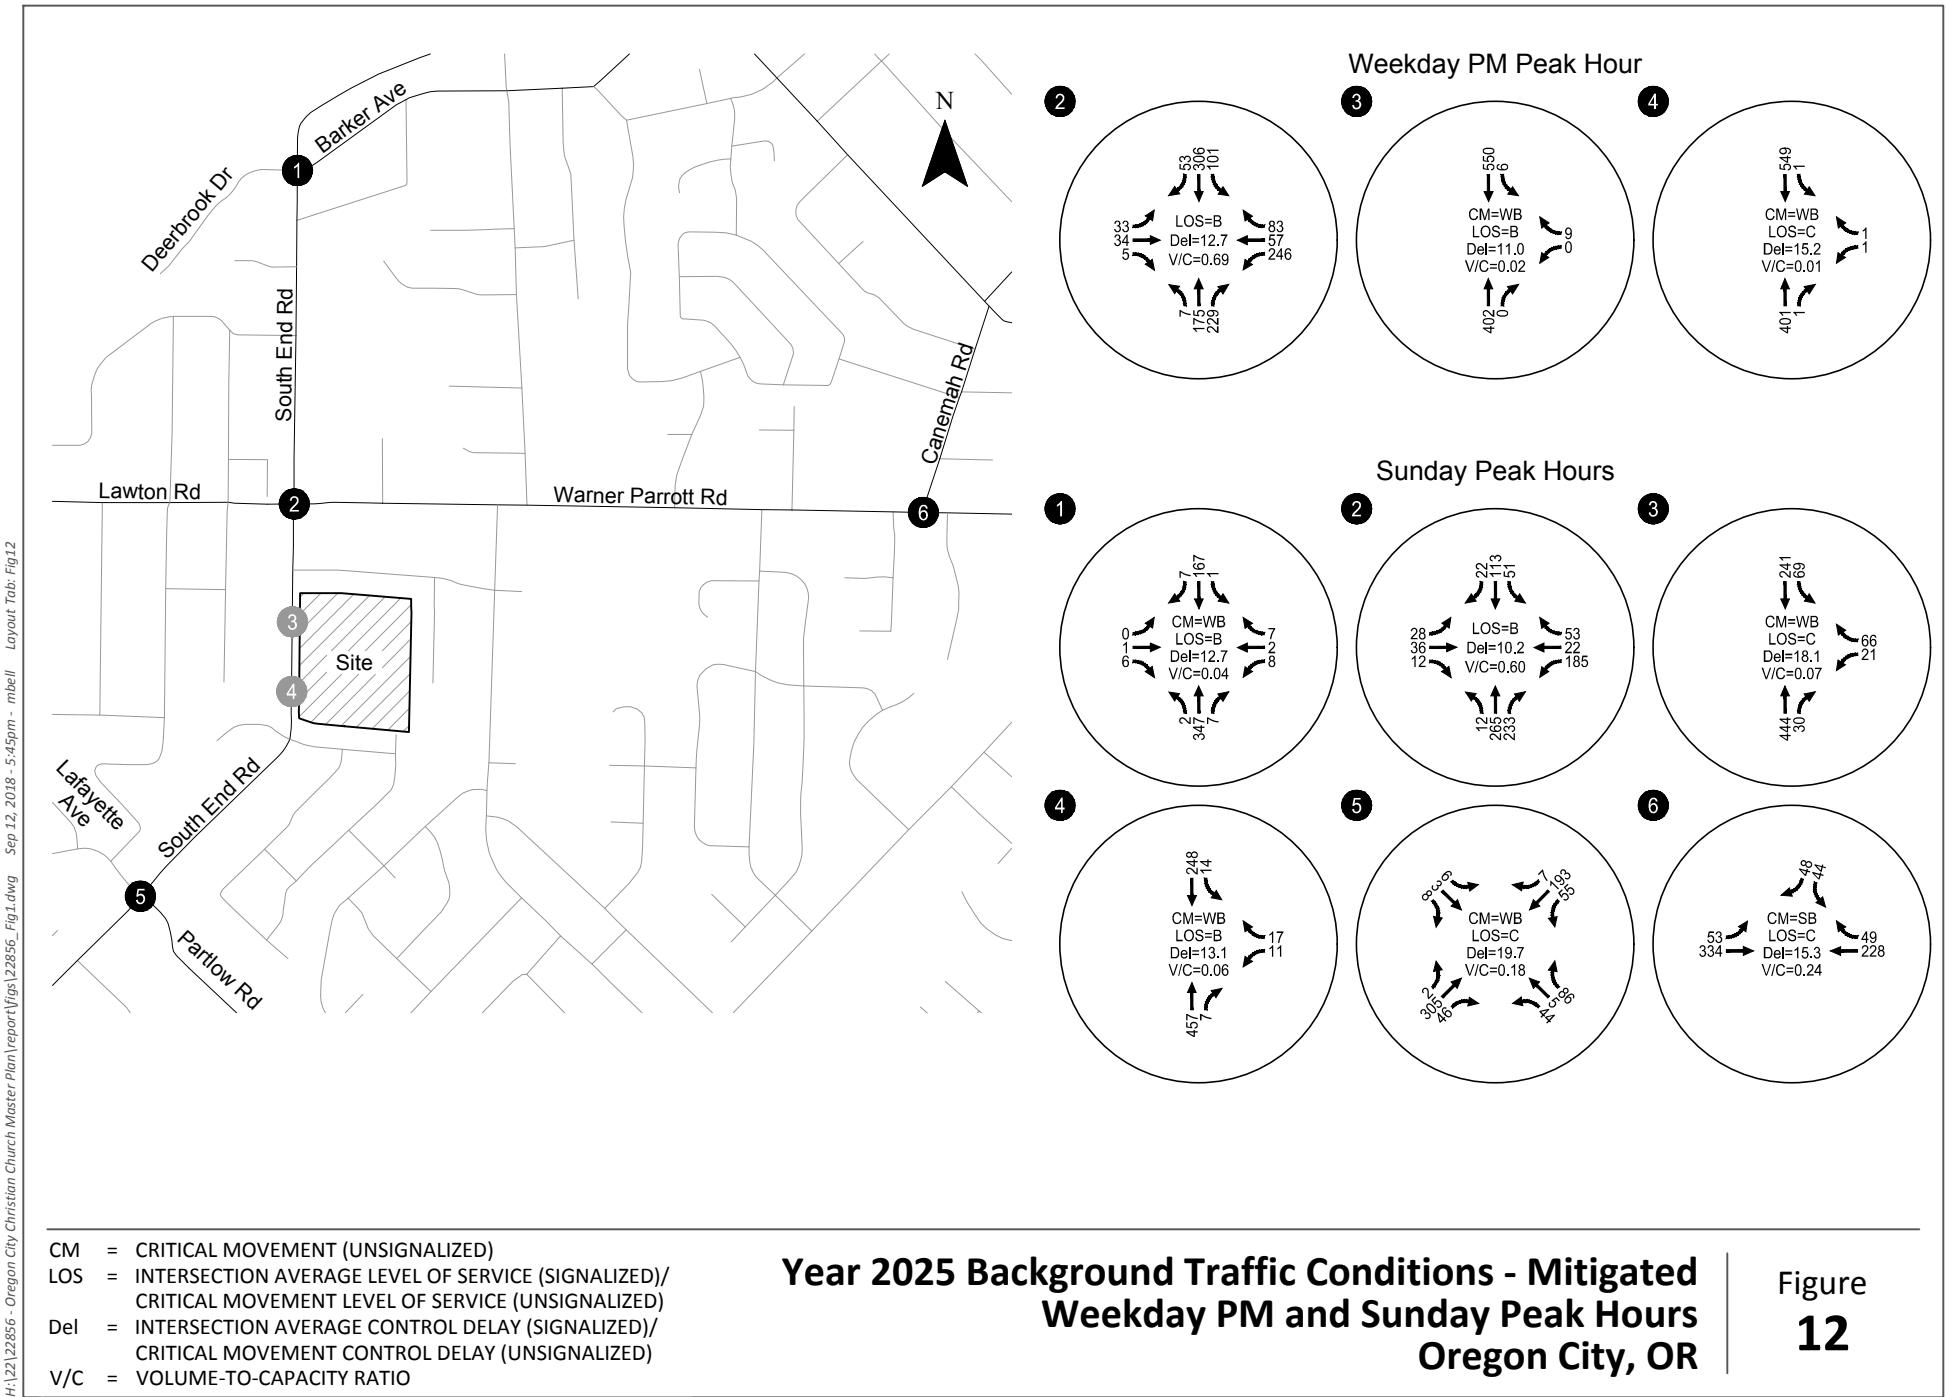

Figure 11 summarizes the year 2025 background traffic conditions at the study intersections during the weekday PM and Sunday peak hours. As shown, all of the study intersections are forecast to operate acceptably per their applicable mobility standards with the exception of the South End Road/Warner Parrott Road intersection. *Appendix "J" includes the year 2025 background traffic conditions worksheets.*

South End Road/Warner Parrott Road

The northbound and southbound approaches to the South End Road/Warner Parrott Road intersection are projected to operate at LOS "F" and near capacity during the weekday PM peak hour. A preliminary signal warrant analysis indicates that a traffic signal is expected to be warranted. This finding is consistent with the Oregon City Transportation System Plan and its identified Project D32². Figure 12 summarizes the year 2025 background traffic condition at the study intersections during the weekday PM and Sunday peak hours assuming installation of a traffic signal at the intersection (but without the additional left-turn lanes identified in TSP Project D32). *Appendix "K" includes the year 2025 background traffic conditions (mitigated) worksheets.*

² As previously noted, project D32 is the South End Road/Warner Parrott Road Operational Enhancement – Install a traffic signal with dedicated left-turn lanes for the South End Road approaches to Warner Parrott Road

Figure
11

PHASE 3 DEVELOPMENT PLAN

Phase 3 of the Master Plan includes construction of a new 4,077 sf administrative building. Full build-out and occupancy of Phase 3 is expected to occur in 2025.

Trip Generation

Recognizing there is already an administrative function on-site today, a trip generation estimate was prepared for Phase 3 of the Master Plan based on information provided in the standard reference manual, *Trip Generation, 10th Edition*, published by the Institute of Transportation Engineers (ITE – Reference 5). ITE Land Use Code 710 (General Office) was used as a basis for the analysis. Table 5 summarizes the daily, weekday PM, Sunday, and Sunday peak hour trips associated with Phase 3 of the Master Plan.

Table 5: Phase 3 Trip Generation

Phase	Size	Daily Trips (Weekday)	Weekday PM Peak Hour of Adjacent Street			Daily Trips (Sunday)	Sunday Peak Hour of Generator		
			Total	In	Out		Total	In	Out
3	3,602 sf	40	5	1	4	3	1	1	0

Site Trip Distribution/Trip Assignment

The site-generated trips shown in Table 5 were distributed to the study area roadways according to the trip distribution pattern shown in Figure 13. Figure 13 also illustrates the assignment of Phase 3 site-generated trips at the study intersections during the weekday PM and Sunday peak hours.

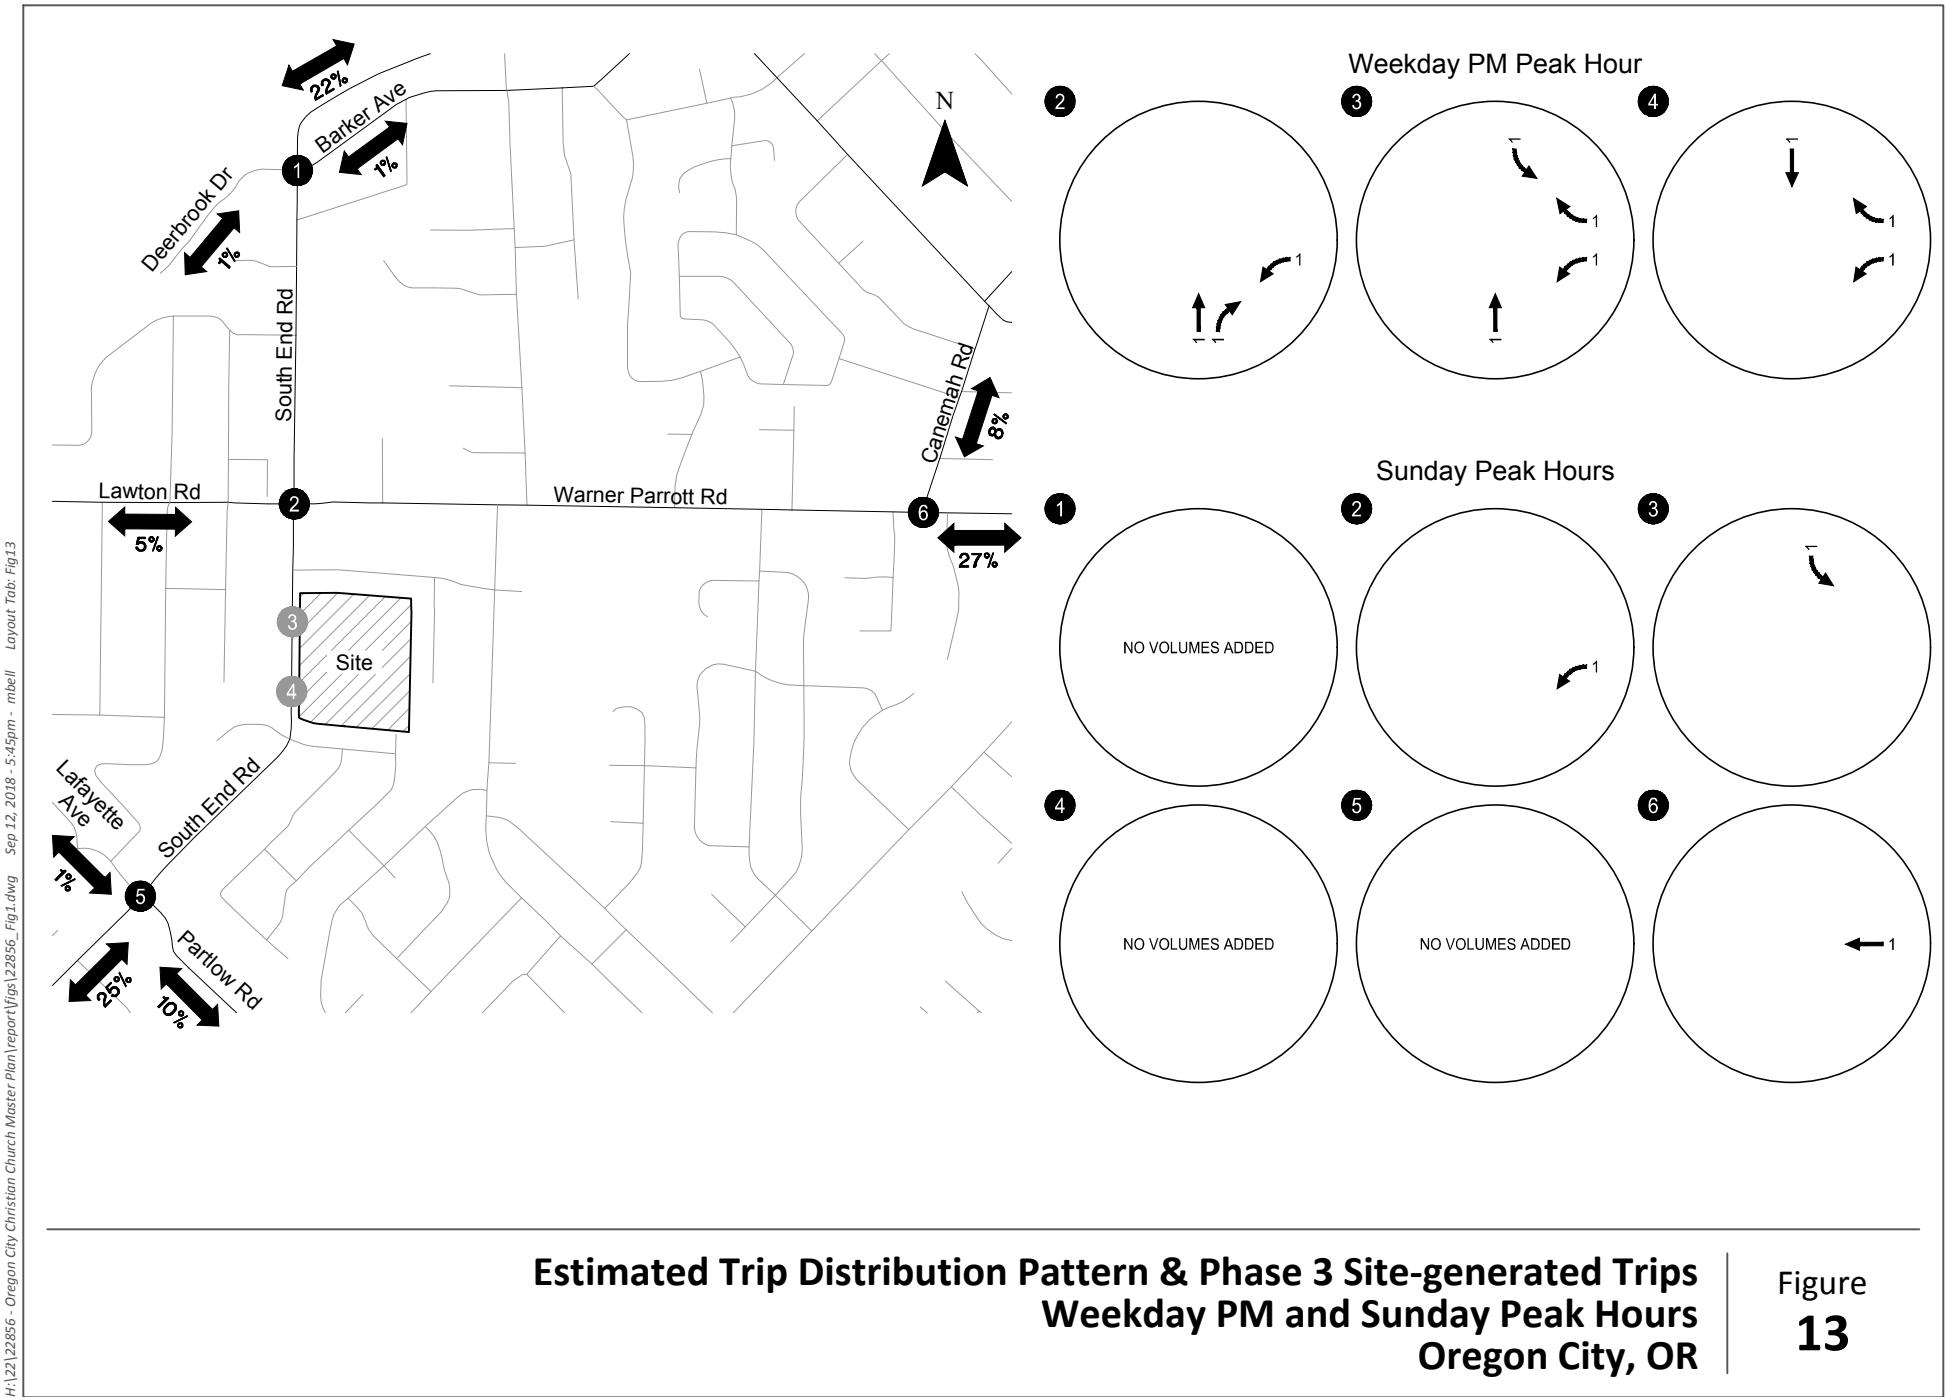

YEAR 2025 TOTAL TRAFFIC CONDITIONS

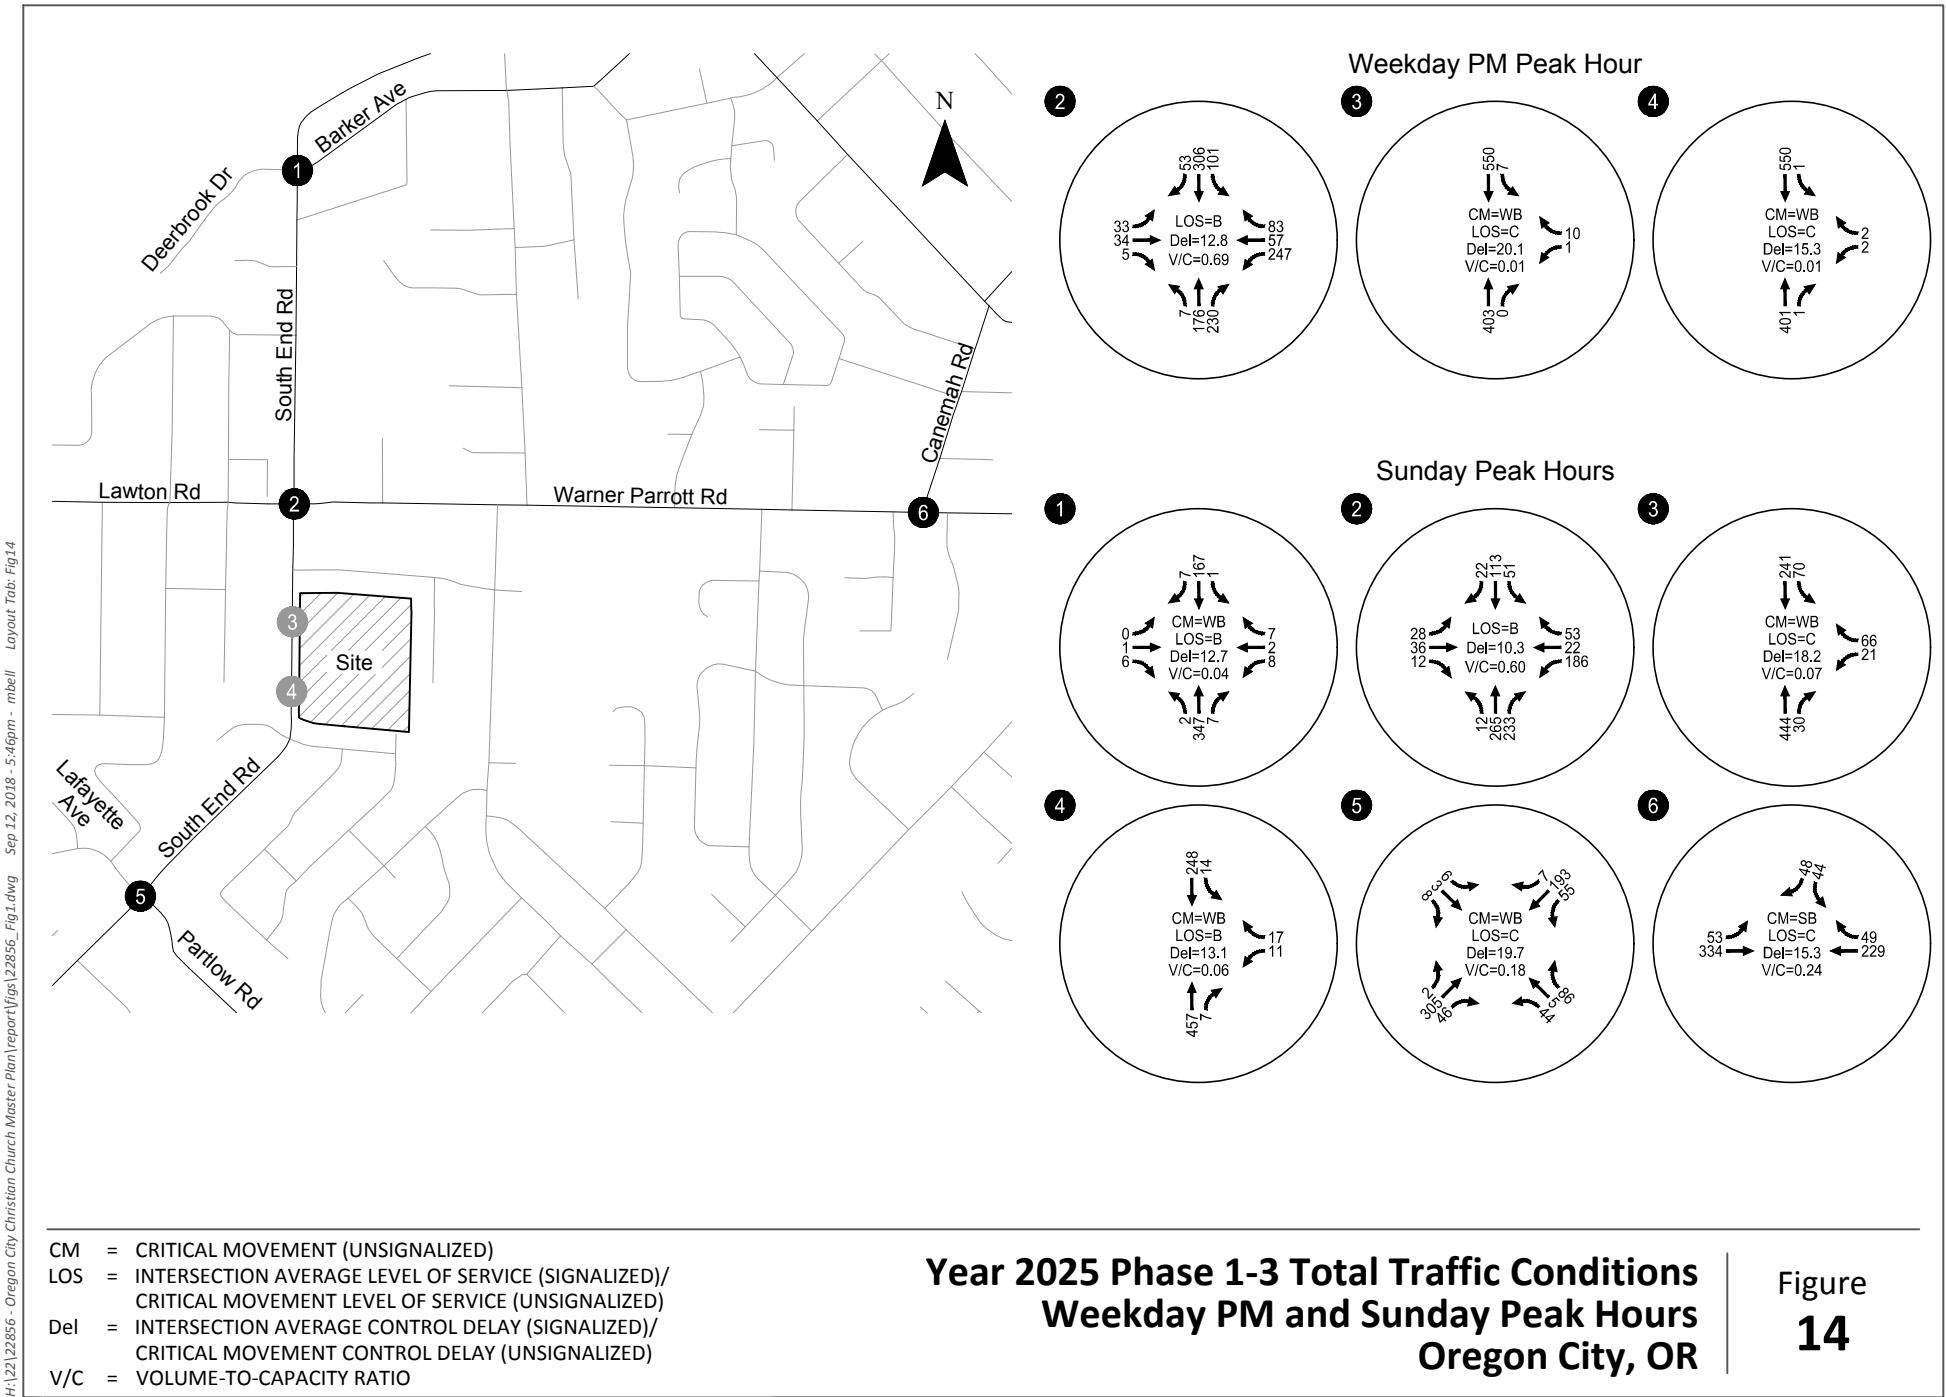

The total traffic conditions analysis forecasts how the study area's transportation system will operate with traffic generated by Phases 1-3 of the Master Plan. The year 2025 background traffic volumes shown in Figure 12 were added to the site-generated trips shown in Figure 13 to arrive at the total traffic volumes shown in Figure 14.

Intersection Level of Service

Figure 14 summarizes the year 2025 Phases 1-3 total traffic conditions analysis results at the study intersections during the weekday PM and Sunday peak hours. As shown, all of the study intersections and site driveway are forecast to operate acceptably per their applicable mobility standards assuming provision of a traffic signal at the South End Road/Warner Parrott Road intersection.

Subject to City direction, the Church Master Plan Phase 3 traffic impacts to the South End Road/Warner Parrott Road intersection could potentially be mitigated through payment of a proportionate share towards the City's Transportation System Plan Project D32. Alternatively, the need for intersection improvements associated with site development could be re-evaluated prior to Phase 3 development. *Appendix "L" includes the year 2025 total traffic conditions worksheets.*

YEAR 2030 BACKGROUND TRAFFIC CONDITIONS

The year 2030 background traffic conditions analysis identifies how the study area's transportation system will operate in the year Phase 4 of the Master Plan is expected to be fully built, 2030. This analysis includes traffic attributed to Phases 1-3 of the Master Plan and to general growth in the region but does not include traffic from Phase 4 of the Master Plan.

Traffic Volumes

The year 2030 background traffic volumes were developed by applying a 22.8 percent growth rate (1.90 percent per year for 12 years) to the existing traffic volumes shown in Figure 4 and by adding the Phase 1 site-generated trips shown in Figure 6, the Phase 2 site-generated trips shown in Figure 9, and the Phase 3 site-generated trips shown in Figure 13. Figure 15 illustrates the resulting forecast year 2030 background traffic volumes at the study intersection during the weekday PM and Sunday peak hours.

Level-of-Service Analysis

Figure 15 summarizes the year 2030 background traffic conditions at the study intersections during the weekday PM and Sunday peak hours. As shown, all of the study intersections are forecast to operate acceptably per their applicable mobility standards. *Appendix "M" includes the year 2030 background traffic conditions worksheets.*

PHASE 4 DEVELOPMENT PLAN

Phase 4 of the Master Plan includes renovation of the existing worship center and construction of the new worship center and café. While the size of the new worship center and café has not been determined; the church is planning to develop the new worship center to accommodate up to 600 parishioners. Full build-out and occupancy of Phase 4 is expected to occur in 2030.

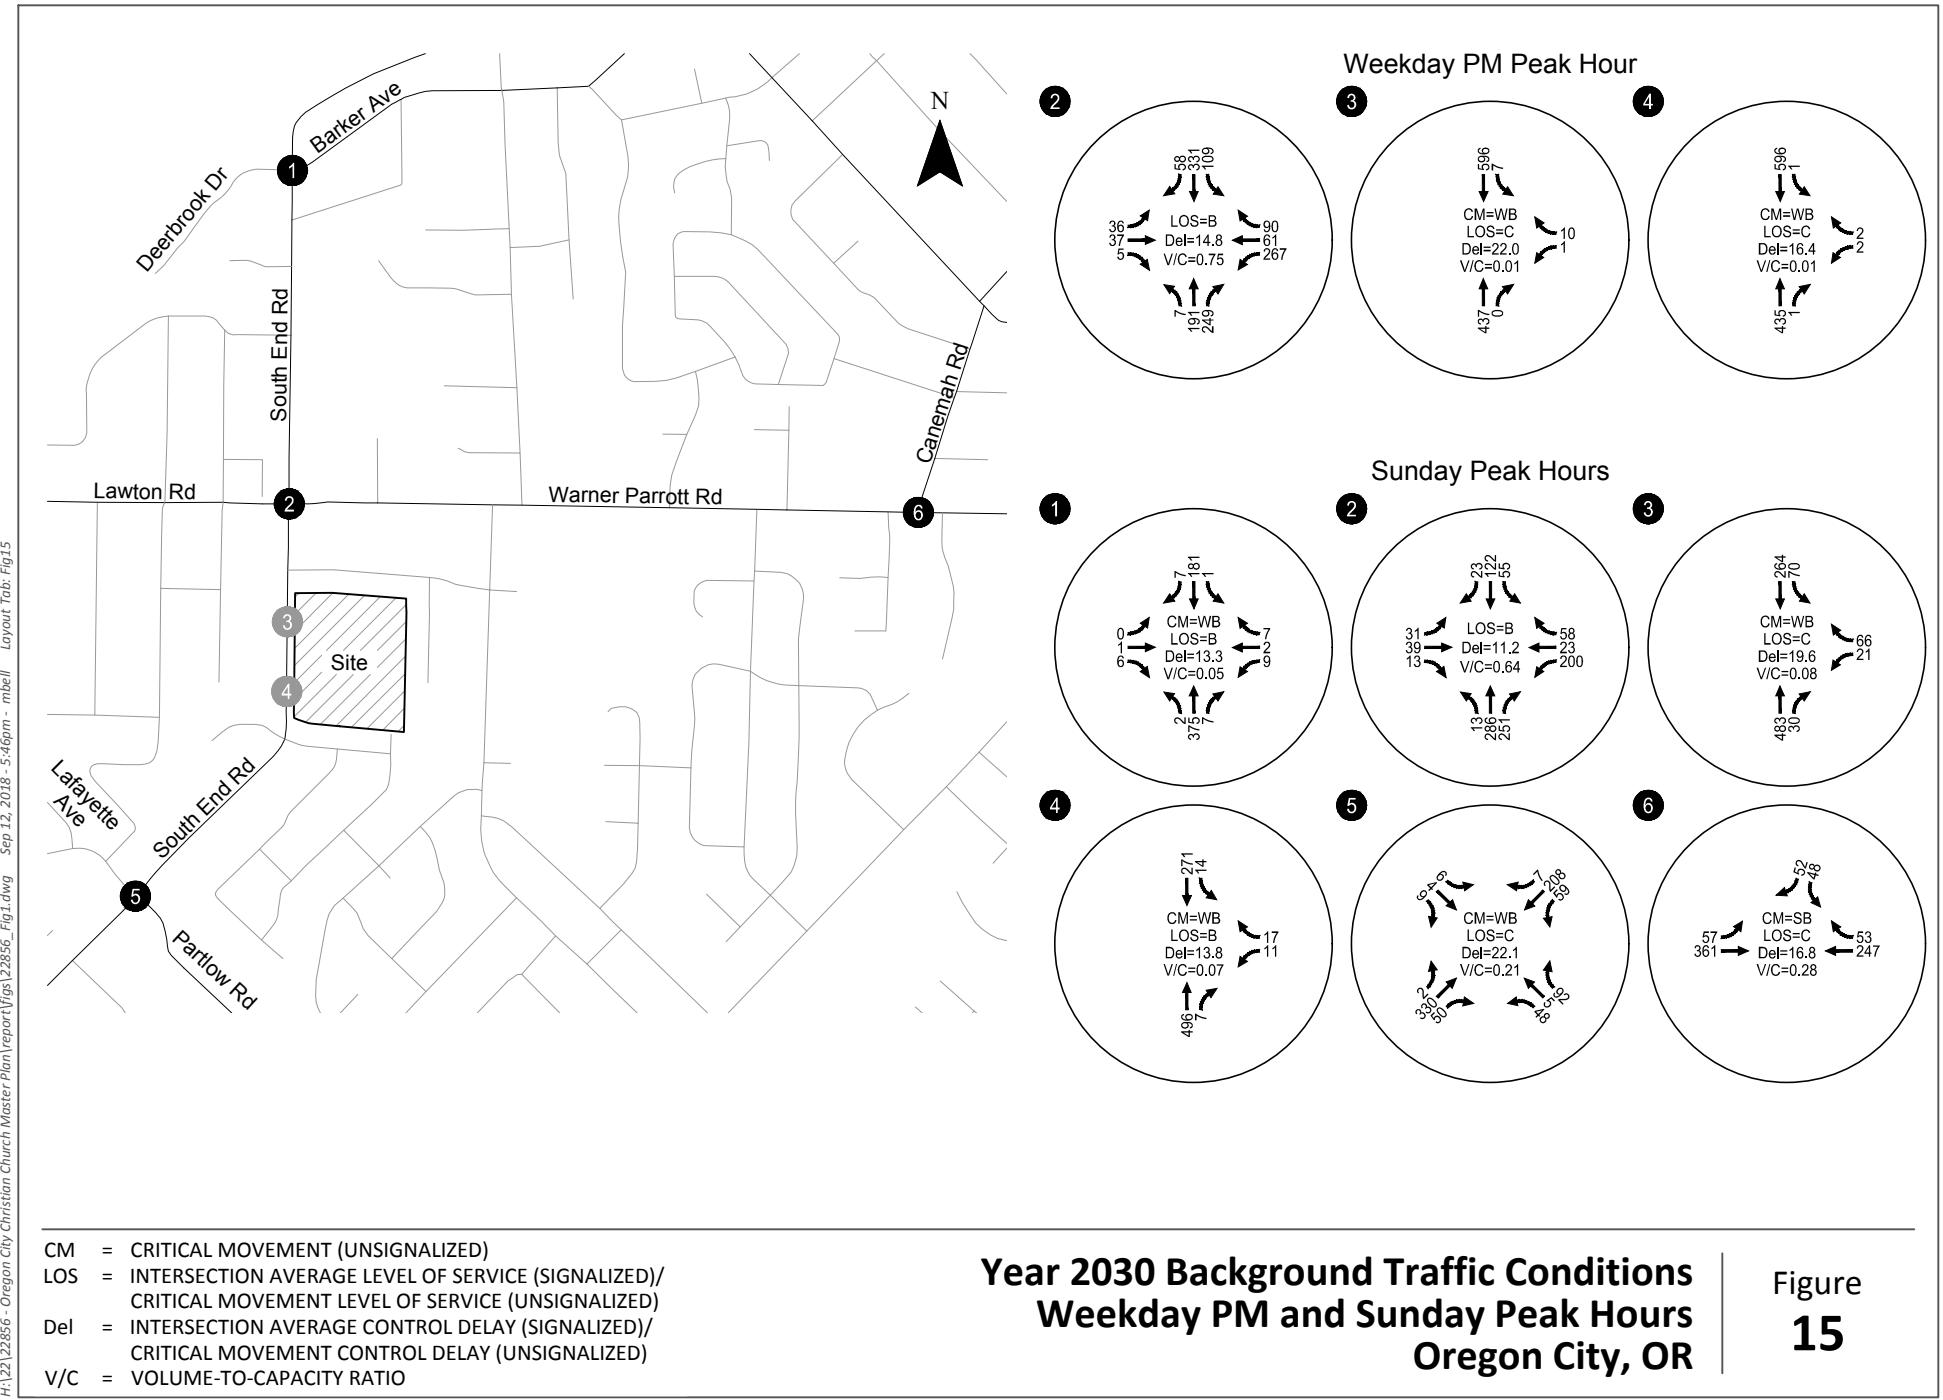

Trip Generation

Trip generation estimates were prepared for Phase 4 of the Master Plan based on a trip generation study conducted at the church in July 2018. *Appendix "A" contains additional information related to the trip generation study.* Table 6 summarizes the daily, weekday PM, Sunday, and Sunday peak hour trips associated with Phase 4 of the Master Plan.

Table 6: Phase 4 Trip Generation

Phase	Size	Daily Trips (Weekday)	Weekday PM Peak Hour of Adjacent Street			Daily Trips (Sunday)	Sunday Peak Hour of Generator		
			Total	In	Out		Total	In	Out
4	17,000 sf ¹	134	12	6	6	464	149	66	83

1. While the size of the new worship center and café has not been determined, the church is planning to accommodate up to 600 parishioners. This represents a 100 percent increase in the church's current seating capacity (300), which is accommodated by their current 17,000 square-foot building.

Site Trip Distribution/Trip Assignment

The site-generated trips shown in Table 6 were distributed to the study area roadways according to the trip distribution pattern shown in Figure 16. Figure 16 also illustrates the assignment of Phase 4 site-generated trips at the study intersections during the weekday PM and Sunday peak hours.

YEAR 2030 TOTAL TRAFFIC CONDITIONS

The total traffic conditions analysis forecasts how the study area's transportation system will operate with traffic generated by Phases 1-4 of the Master Plan. The year 2030 background traffic volumes shown in Figure 15 were added to the site-generated trips shown in Figure 16 to arrive at the total traffic volumes shown in Figure 17.

Intersection Level of Service

Figure 17 summarizes the year 2030 total traffic conditions analysis results at the study intersections during the weekday PM and Sunday peak hours. As shown, all of the study intersections are forecast to operate acceptably per their applicable mobility standards.

Subject to City direction, the Church Master Plan Phase 4 traffic impacts to the South End Road/Warner Parrott Road intersection could potentially be mitigated through payment of a proportionate share towards the City's Transportation System Plan Project D32. Alternatively, the need for the South End Road/Warner Parrott Road intersection improvements associated with site development could be re-evaluated prior to Phase 4 development. *Appendix "N" includes the year 2030 total traffic conditions worksheets.*

SITE-ACCESS OPERATIONS

Figure 2 illustrates the conceptual site plan. As shown, access to the site is planned to be provided by one full movement driveway toward the northern end of the site and one full movement driveway toward the southern end of the site. Both driveways are expected to operate acceptably in the future under stop control and queues at the driveways are not expected to exceed one vehicle entering the site. While the Synchro analysis shows that queues exiting the site are also not expected to exceed one vehicle, the site provides storage for up to four vehicles per lane.

We recommend that adequate intersection sight distance should be provided at both site driveways in accordance with City of Oregon City standards.

CONCLUSIONS AND RECOMMENDATIONS

The results of this study indicate that the Oregon City Christian Church Master Plan can be developed while maintaining acceptable traffic operations and safety at the study intersections, assuming provision of the recommended mitigation measures. The findings of this analysis and our recommendations are discussed below.

FINDINGS

Year 2018 Existing Traffic Conditions

- All of the study intersections operate acceptably during the weekday PM and Sunday peak hours.
- A review of historical crash data did not reveal any patterns or trends in the site vicinity that require mitigation associated with this project.

Year 2020 Background Traffic Conditions

- All of the study intersections are forecast to operate acceptably during the weekday PM and Sunday peak hours.

Phase 1 Development Plan

- Phase 1 of the Master Plan includes construction of a new 8,168 sf recreation center, new parking facilities, and a new driveway along the southern boundary of the site.
- Phase 1 is estimated to generate 64 weekday daily trips, including 6 trips (3 inbound, 3 outbound) during the weekday PM peak hour, and 222 Sunday daily trips, including 72 trips (32 inbound, 40 outbound) during the Sunday peak hour.

Year 2020 Total Traffic Conditions (Master Plan Phase 1)

- All of the study intersections and site driveways are forecast to operate acceptably during the weekday PM and Sunday peak hours.

Year 2022 Background Traffic Conditions

- All of the study intersections are forecast to operate acceptably during the weekday PM and Sunday peak hours.

Phase 2 Development Plan

- Phase 2 of the Master Plan includes construction of a new 3,602 sf student ministry center.

- Phase 2 is estimated to generate 28 weekday daily trips, including 2 trips (1 inbound, 1 outbound) during the weekday PM peak hour, and 98 Sunday daily trips, including 32 trips (14 inbound, 18 outbound) during the Sunday peak hour.

Year 2022 Total Traffic Conditions (Master Plan Phases 1 & 2)

- All of the study intersections and site driveways are forecast to operate acceptably during the weekday PM and Sunday peak hours.

Year 2025 Background Traffic Conditions

- All but one of the study intersections are forecast to operate acceptably during the weekday PM and Sunday peak hours.
- The northbound and southbound approaches to the South End Road/Warner Parrott Road intersection are projected to operate at LOS "F" and near capacity during the weekday PM peak hour. A preliminary signal warrant analysis indicates that a traffic signal is expected to be warranted.
 - The City of Oregon City Transportation Plan project D32 includes installation of a traffic signal with dedicated left-turn lanes for the South End Road approaches to Warner Parrott Road in the 2018 to 2023 horizon period. Project D32 is not currently programmed or funded.
 - Signalization of the intersection without the additional turn lanes would restore acceptable peak hour operations.

Phase 3 Development Plan

- Phase 3 of the Master Plan includes construction of a new 4,077 sf administrative building.
- Phase 3 is estimated to generate 40 weekday daily trips, including 5 trips (1 inbound, 4 outbound) during the weekday PM peak hour, and 3 Sunday daily trips, including 1 trip (1 inbound, 0 outbound) during the Sunday peak hour.

Year 2025 Total Traffic Conditions (Master Plan Phases 1-3)

- All of the study intersections and site driveways are forecast to operate acceptably per their applicable mobility standards assuming provision of a traffic signal at the South End Road/Warner Parrott Road intersection.
 - The Church Master Plan Phase 3 traffic impacts to the South End Road/Warner Parrott Road intersection could potentially be mitigated through payment of a proportionate share towards the City's Transportation System Plan Project D32. Alternatively, the need for the South End Road/Warner Parrott Road intersection improvements associated with site development could be re-evaluated prior to Phase 3 development.

Year 2030 Background Traffic Conditions

- All of the study intersections are forecast to operate acceptably during the weekday PM and Sunday peak hours.

Phase 4 Development Plan

- Phase 4 of the Master Plan includes renovation of the existing worship center and construction of the new worship center and café.
- Phase 4 is estimated to generate 134 weekday daily trips, including 12 trips (6 inbound, 6 outbound) during the weekday PM peak hour, and 464 Sunday daily trips, including 149 trip (66 inbound, 83 outbound) during the Sunday peak hour.

Year 2030 Total Traffic Conditions (Master Plan Phase 1-4)

- All of the study intersections and site driveway are forecast to operate acceptably per their applicable mobility standards.
 - The Church Master Plan Phase 4 traffic impacts to the South End Road/Warner Parrott Road intersection could potentially be mitigated through payment of a proportional share towards the City's Transportation System Plan Project D32. Alternatively, the need for the South End Road/Warner Parrott Road intersection improvements associated with site development could be re-evaluated prior to Phase 4 development.

Site Access Operations

- The two site driveways on South End Road will operate acceptably with stop control approaching South End Road.
- Queues at the site driveways are not expected to exceed 25 feet entering or exiting the site.

RECOMMENDATIONS

The following list summarizes the mitigation measures recommended as part of this proposed development.

- Subject to City direction, the Phase 3 and Phase 4 site development should pay a proportionate share contribution toward future installation of a traffic signal at the South End Road/Warner Parrott Road intersection prior to completion of the two respective development phases. Alternatively, the need for the South End Road/Warner Parrott Road intersection improvements associated with Phase 3 and Phase 4 site development could be re-evaluated prior to the two respective development phases.
- Adequate intersection sight distance should be provided at both site driveways on South End Road in accordance with City of Oregon City standards.

MEMORANDUM

Date: August 23, 2018

Project #: 22856.0

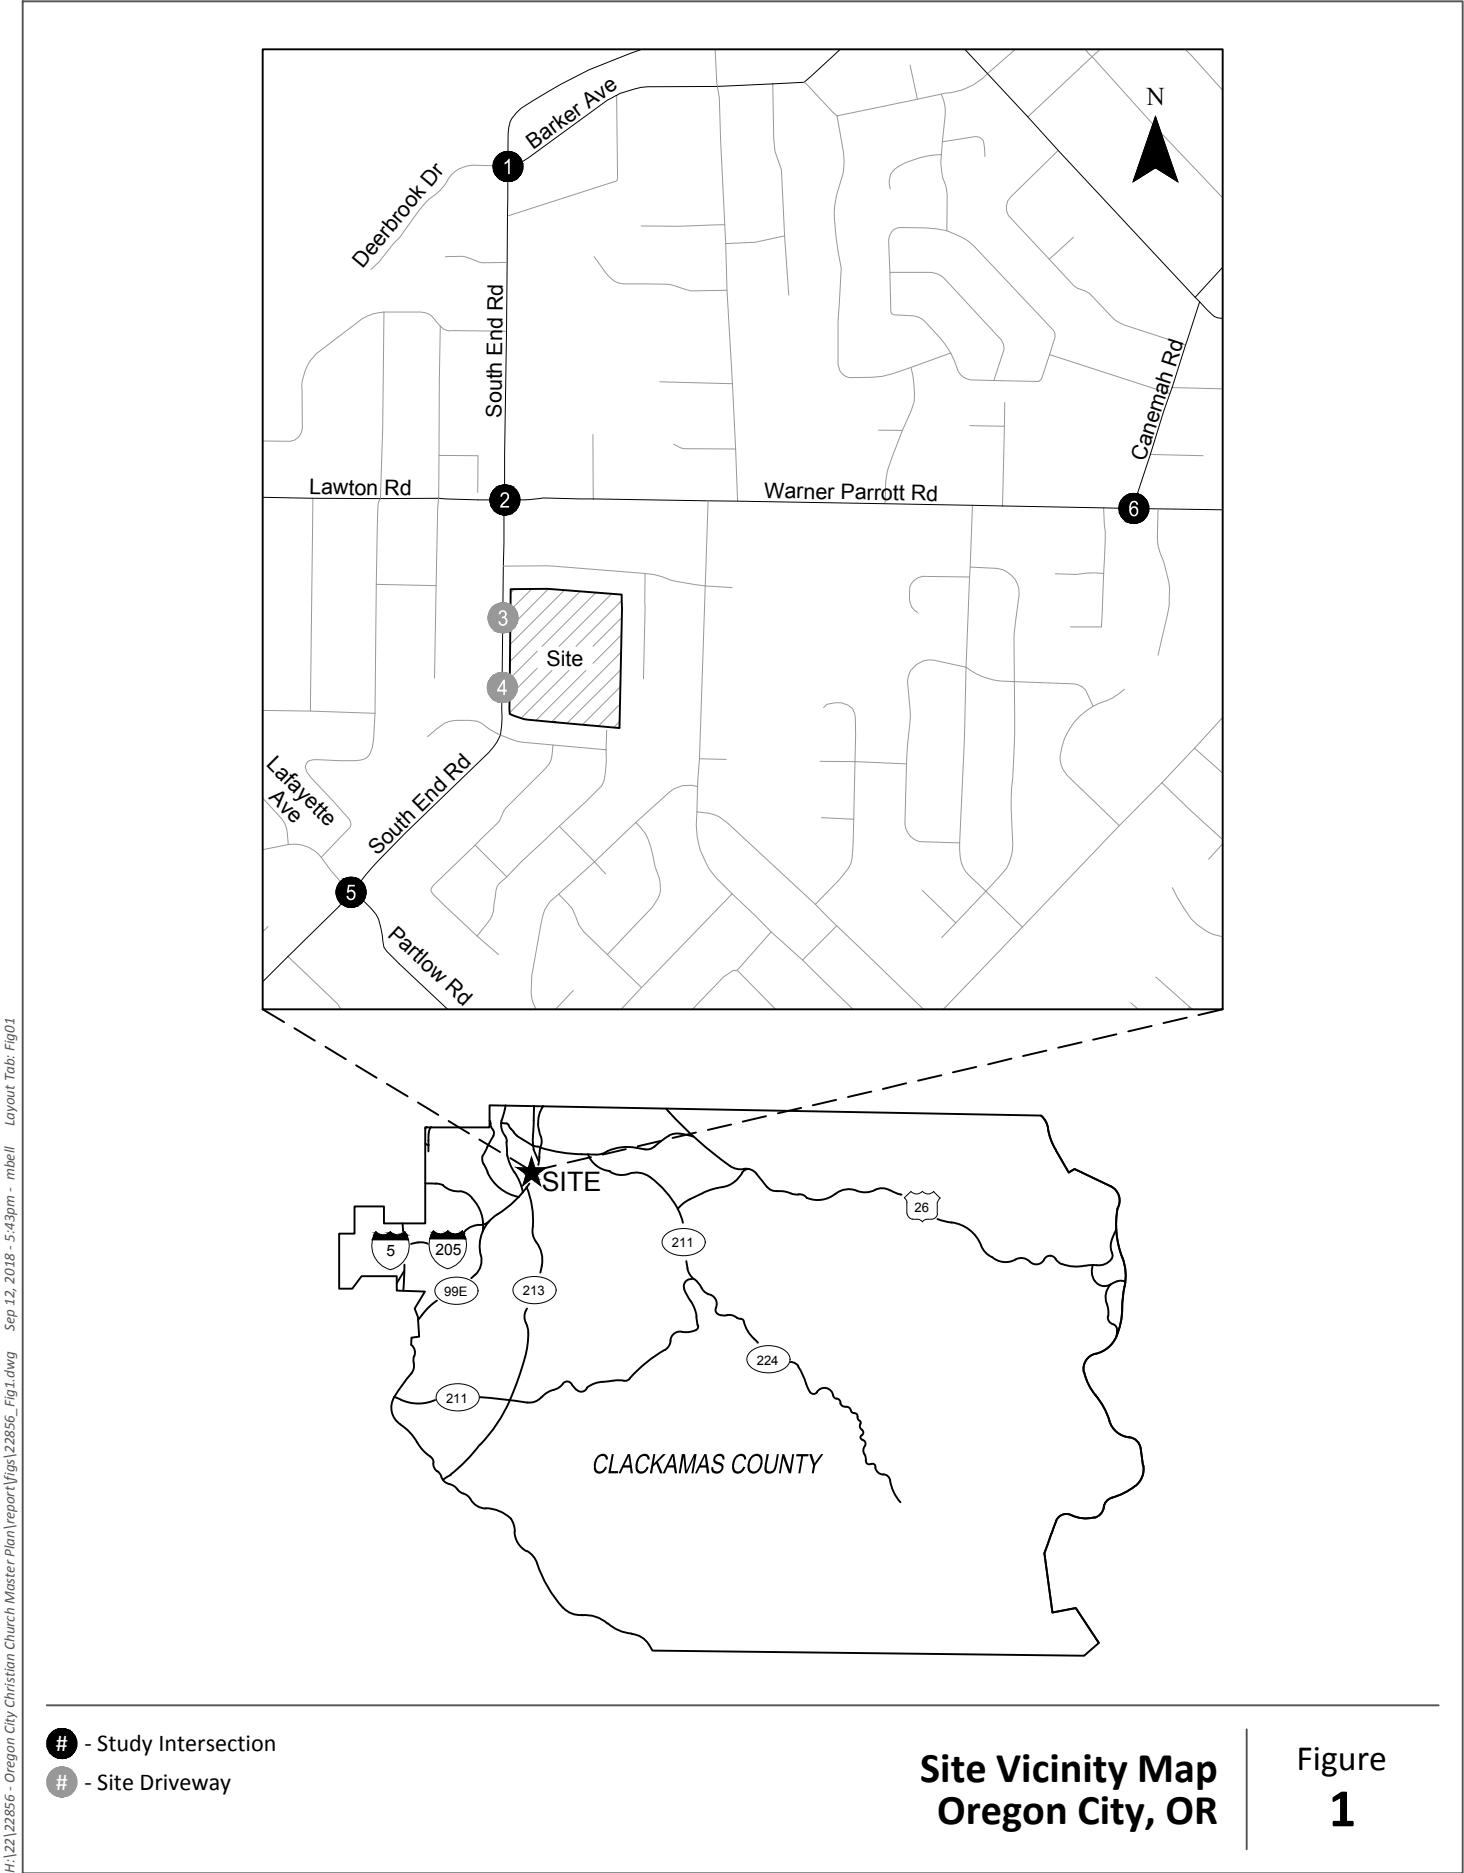

To: Pete Walter, City of Oregon City
John Replinger, P.E., Replinger & Associates, LLC
CC: Brent Brelje, Oregon City Christian Church
From: Matt Bell and Chris Brehmer, P.E., Kittelson & Associates, Inc.
Project: Oregon City Christian Church Master Plan
Subject: Transportation Impact Study – Key Assumptions

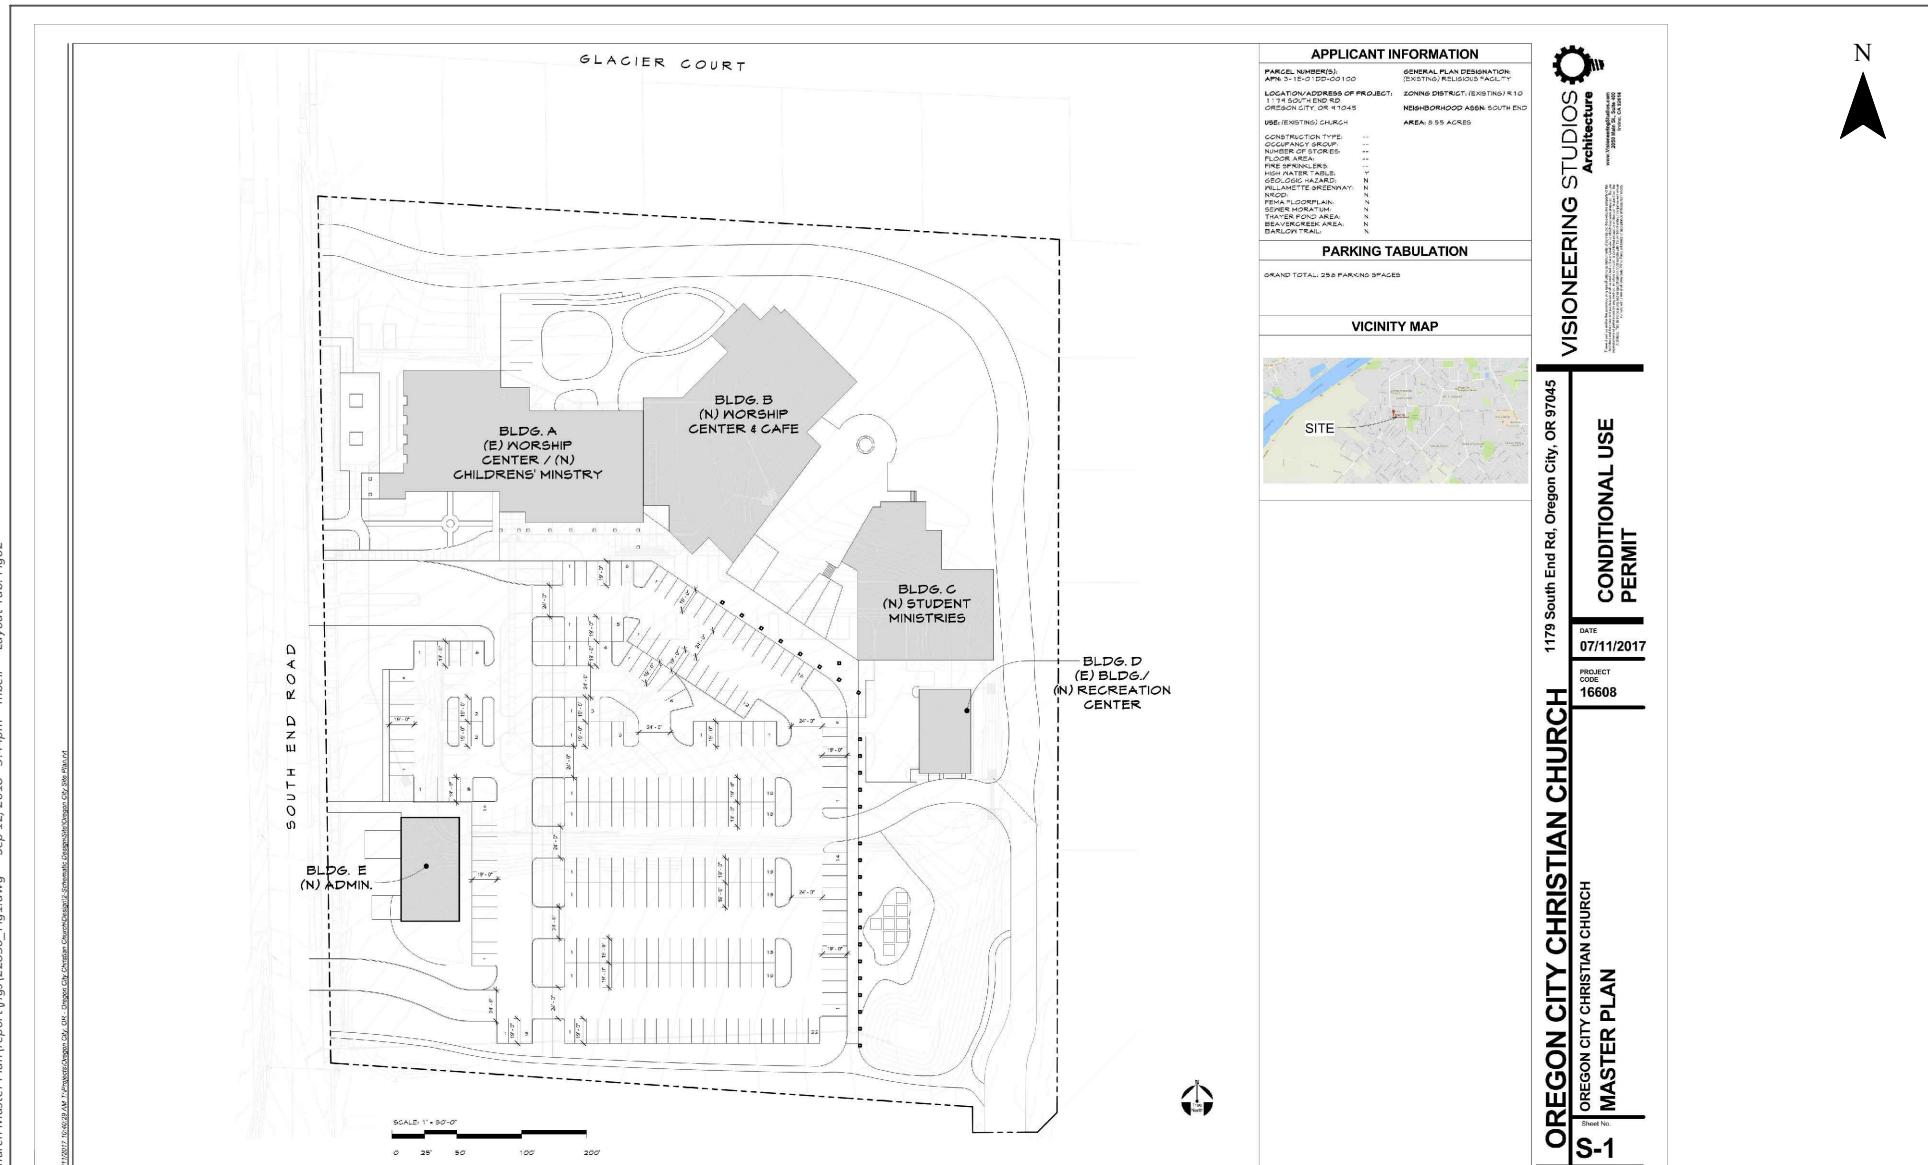

This memorandum summarizes key assumptions associated with preparing a Transportation Impact Study (TIS) for the proposed Oregon City Christian Church Master Plan. These assumptions are based on a review of the proposed Master Plan, the City of Oregon City Guidelines for Transportation Impact Analyses (TIA Guidelines), and pre-application conference notes prepared by City of Oregon City, and discussions with the project team.

Project Background

The proposed Oregon City Christian Church Master Plan identifies the vision and long-term goals for the existing church campus located along the east side of South End Road in Oregon City. Figure 1 illustrates the site vicinity map. The Master Plan includes renovation of the existing worship center and phased construction of a new recreation center, a new student ministry center, a new administrative building, and a new worship center and café. The Master Plan also includes expansion of the existing parking facilities and a new driveway along the southern boundary of the site. Figure 2 illustrates the conceptual site plan. Construction of the new facilities is expected to occur in four phases over a 10-year period as follows:

- Phase 1 is expected to occur in 2020 and include a new 8,168 square-foot recreation center, new parking facilities, and a new driveway along the southern boundary of the site;
- Phase 2 is expected to occur in 2022 and include new 3,602 square-foot student ministry center;
- Phase 3 is expected to occur in 2025 and include a new 4,077 square-foot administrative building; and
- Phase 4 is expected to occur in 2030 and include renovation of the existing worship center and construction of the new worship center and café.
 - The size of the new worship center and café has not been determined; however, the church is planning to develop the new worship center to accommodate up to 600 parishioners.

The TIS will include an evaluation of traffic operations during each phase of the Master Plan as necessary to determine the transportation-related impacts and potential off-site mitigations.

Trip Generation

Trip generation estimates were prepared for Phases 1, 2, and 4 of the Master Plan based on data collected at the existing church over three consecutive mid-week days (Tuesday, Wednesday, and Thursday) and one weekend day (Sunday). The data includes the total number of vehicles that entered and exited the main entrance to the church in 15-minute increments. Supplemental data provided by the church includes the size of the existing worship center and the total number of people that participated in events on Sunday. The data was used to develop trip rates per 1,000 square-feet of building space and per attendee.

Recognizing there is already an administrative function on-site today, a trip generation estimate was prepared for Phase 3 of the master plan (new administrative building) based on information provided in the standard reference manual, *Trip Generation, 10th Edition*, published by the Institute of Transportation Engineers (ITE). ITE Land Use Code 710 (General Office) was used as a basis for the analysis.

The existing church and ITE trip rates were used to develop trip generation estimates for the Master Plan. Table 1 summarizes the daily, weekday AM, weekday PM, Sunday, and Sunday peak hour trips associated with each phase of the Master Plan. *Attachment A contains additional information related to the trip generation rates.*

Table 1: Trip Generation

Phase	Size	Daily Trips (Weekday)	Weekday AM Peak Hour of Adjacent Street			Weekday PM Peak Hour of Adjacent Street			Daily Trips (Sunday)	Sunday Peak Hour of Generator

1. While the size of the new worship center and café has not been determined, the church is planning to accommodate up to 600 parishioners. This represents a 100 percent increase in the church's current seating capacity (300), which is accommodated by their current 17,000 square-foot building.

Trip Distribution/Assignment

The trips shown in Table 1 will be distributed onto the study area roadways based on existing traffic patterns and the location of major trip origins and destinations in the study area. The trips will be assigned to the site driveways and study intersections in accordance with the trip distribution pattern.

Study Area

The study area for the TIS will include the major streets (collector and above) located adjacent to the proposed development site along with the site access driveways and several major intersections. The intersections were determined based on a review of the City's functional classification plan, a review of historical traffic data within the study area, and guidance provided in the TIA Guidelines. The intersections include:

1. South End Road/Barker Avenue
2. South End Road/Warner Parrot Road
3. South End Road/Existing Church Driveway (Dwy 1)
4. South End Road/Future Church Driveway (Dwy 2)
5. South End Road/Partlow Road
6. Canemah Road/Warner Parrot Road

Analysis Years

The analysis years for the TIS reflect each phase of the Master Plan. The analysis years include:

- Existing traffic conditions
- Year 2020 Background traffic conditions, without the proposed development
- Year 2020 Total Traffic Conditions, with Phase 1 of the proposed development
- Year 2022 Background traffic conditions, with Phase 1 of the proposed development
- Year 2022 Total Traffic Conditions, with Phase 1-2 of the proposed development
- Year 2025 Background Traffic Conditions, with Phase 1-2 of the proposed development
- Year 2025 Total Traffic Conditions, with Phase 1-3 of the proposed development
- Year 2030 Background Traffic Conditions, with Phase 1-3 of the proposed development
- Year 2030 Total Traffic Conditions, with Phase 1-4 of the proposed development

It may be determined that some phases do not result in significant impacts to the transportation system. These phases may be combined with other phases in the TIS if appropriate to simplify the City's review and approval conditions.

Analysis Periods

The analysis periods for the TIS were determined based on the type of use, the type of adjacent uses, the trip generation estimate provided above, and guidance provided in the TIA Guidelines. The TIS will include an evaluation of the weekday evening (4:00 to 6:00 PM) peak period at the site driveways and the South End Road/Warner Parrot Road intersection and the Sunday mid-day (8:00 to 12:00) peak period at the site driveways and all six study intersections identified above.

Analysis Tools and Methodology

The TIA will evaluate traffic operations at the study intersections based on the methodologies identified in the 2010 Highway Capacity Manual (HCM – Reference 1). Synchro 9 will be used to evaluate traffic operations at the study intersections. Synchro 9 is a software tool designed to assist with operations analysis in accordance with 2010 HCM methodologies.

Performance Measures

Traffic operations at the study intersections will be evaluated based on the applicable performance measures. Per the TIA Guidelines, all of the unsignalized study intersections are expected to operate at Level of Service (LOS) "E" or better for the poorest operating approach and with no movement serving more than 20 peak hour vehicles operating at worse than LOS "E". In other words, LOS "F" will be tolerated for minor movements during a peak hour.

Next Steps

We trust this memorandum provides adequate documentation of the key assumptions associated with the TIS for the proposed Oregon City Church Master Plan development.

We request that the City provide written confirmation regarding the proposed methodology and project assumptions as soon as possible so that we may proceed with our analysis. In addition, we would appreciate the City providing timing of planned improvements at the study intersections, information on planned developments and in-process trips that could impact the study intersections, and an approved background growth rate that should be incorporated into the traffic analysis.

Attachment A Trip Generation Rates

TRIP GENERATION STUDY

Trip generation data was collected at the main entrance to the Oregon City Christian Church over three consecutive mid-week days (Tuesday, Wednesday, and Thursday) and one weekend day (Sunday) in July 2018. The data includes the total number of vehicles that entered and exited the main entrance to the church in 15-minute increments. Supplemental data provided by the church includes the size of the existing building and the total number of people that participated in events on Sunday. The data was used to develop trip rates per 1,000 square-feet of building space and per attendee as described below.

Mid-week Trip Rates

The mid-week data shows an average of 133 daily trips at the main entrance to the church over the three-day period, including 6 trips (3 inbound, 3 outbound) during the weekday AM peak hour and 11 trips (5 inbound, 6 outbound) during the weekday PM peak hour. Trip rates were developed for the church by dividing the daily, weekday AM, and weekday PM peak hours trips by the gross square-feet of the existing church (i.e. 133 daily trips / 17,000 square-feet = 7.82 trips per 1,000 square-feet). Table A-1 summarizes the mid-week trip rates developed for the church and compares the rates to data provided in the standard reference manual, *Trip Generation Manual*, published by the Institute of Transportation Engineers (ITE). As shown, the calculated rates are similar to the ITE rates during all time periods.

Table A-1: Trip Rates per 1,000 square-feet

Trip Rates	Daily	Weekday AM Peak Hour			Weekday PM Peak Hour		
		Total	In	Out	Total	In	Out
Calculated Rates	7.82	0.39	50%	50%	0.69	46%	54%
<i>Trip Generation Manual</i>	6.95	0.33	60%	40%	0.49	45%	55%

Sunday Trip Rates

The Sunday data shows a total of 463 daily trips at the main entrance to the driveway, including 149 trips (66 inbound, 83 outbound) during the peak hour. Trip rates (per 1,000 square-feet) were developed for the church by dividing the daily and peak hour trips by the gross square-feet of the existing church (i.e. 463 daily trips / 17,000 square-feet = 27.24 trips per 1,000 square-feet). Table A-2 summarizes the Sunday trip rates developed for the church and compares the rates to data provided in ITE. As shown, the calculated rates are similar to the ITE rates during both time periods.

Table A-2: Trip Rates per 1,000 square-feet

Trip Rates	Daily	Sunday Peak Hour		
		Total	In	Out
Calculated Rates	27.24	8.76	44%	56%
<i>Trip Generation Manual</i>	27.63	9.99	48%	52%

Supplemental data provided by the church shows that 190 parishioners were present for the 9:00 a.m. service and 221 were present for the 10:45 a.m. service. Trip rates (per attendee) were developed for the church by dividing the daily and peak hours trips by the total number of parishioners (i.e. 463 daily trips / 411 daily attendees = 1.13 trips per attendee). Table A-3 summarizes the Sunday trip rates developed for the church and compares the rates to data provided in ITE. As shown, the calculated rate for the peak hour is similar to the ITE rate; however, ITE does not provide a daily rate per attendee.

Appendix C Level of Service Concept

LEVEL OF SERVICE CONCEPT

Level of service (LOS) is a concept developed to quantify the degree of comfort (including such elements as travel time, number of stops, total amount of stopped delay, and impediments caused by other vehicles) afforded to drivers as they travel through an intersection or roadway segment. Six grades are used to denote the various level of service from "A" to "F".¹

Signalized Intersections

The six level-of-service grades are described qualitatively for signalized intersections in Table C1. Additionally, Table C2 identifies the relationship between level of service and average control delay per vehicle. Control delay is defined to include initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. Using this definition, Level of Service "D" is generally considered to represent the minimum acceptable design standard.

Table C1: Level-of-Service Definitions (Signalized Intersections)

Level of Service	Average Delay per Vehicle
A	Very low average control delay, less than 10 seconds per vehicle. This occurs when progression is extremely favorable, and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.
B	Average control delay is greater than 10 seconds per vehicle and less than or equal to 20 seconds per vehicle. This generally occurs with good progression and/or short cycle lengths. More vehicles stop than for a level of service A, causing higher levels of average delay.
C	Average control delay is greater than 20 seconds per vehicle and less than or equal to 35 seconds per vehicle. These higher delays may result from fair progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant at this level, although many still pass through the intersection without stopping.
D	Average control delay is greater than 35 seconds per vehicle and less than or equal to 55 seconds per vehicle. The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle length, or high volume/capacity ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
E	Average control delay is greater than 55 seconds per vehicle and less than or equal to 80 seconds per vehicle. This is usually considered to be the limit of acceptable delay. These high delay values generally (but not always) indicate poor progression, long cycle lengths, and high volume/capacity ratios. Individual cycle failures are frequent occurrences.
F	Average control delay is in excess of 80 seconds per vehicle. This is considered to be unacceptable to most drivers. This condition often occurs with oversaturation. It may also occur at high volume/capacity ratios below 1.0 with many individual cycle failures. Poor progression and long cycle lengths may also contribute to such high delay values.

¹ Most of the material in this appendix is adapted from the Transportation Research Board, Highway Capacity Manual, (2010).

Table C2: Level-of-Service Criteria for Signalized Intersections

Level of Service	Average Control Delay per Vehicle (Seconds)
A	<10.0

C	>20 and \leq 35
D	>35 and \leq 55
E	>55 and \leq 80
F	>80

UNSIGNALIZED INTERSECTIONS

Unsignalized intersections include two-way stop-controlled (TWSC) and all-way stop-controlled (AWSC) intersections. The 2010 Highway Capacity Manual (HCM) provides models for estimating control delay at both TWSC and AWSC intersections. A qualitative description of the various service levels associated with an unsignalized intersection is presented in Table C3. A quantitative definition of level of service for unsignalized intersections is presented in Table C4. Using this definition, Level of Service "E" is generally considered to represent the minimum acceptable design standard.

Table C3: Level-of-Service Criteria for Unsignalized Intersections

Level of Service	Average Delay per Vehicle to Minor Street
A	<ul style="list-style-type: none">Nearly all drivers find freedom of operation.Very seldom is there more than one vehicle in queue.
B	<ul style="list-style-type: none">Some drivers begin to consider the delay an inconvenience.Occasionally there is more than one vehicle in queue.
C	<ul style="list-style-type: none">Many times there is more than one vehicle in queue.Most drivers feel restricted, but not objectionably so.
D	<ul style="list-style-type: none">Often there is more than one vehicle in queue.Drivers feel quite restricted.
E	<ul style="list-style-type: none">Represents a condition in which the demand is near or equal to the probable maximum number of vehicles that can be accommodated by the movement.There is almost always more than one vehicle in queue.Drivers find the delays approaching intolerable levels.
F	<ul style="list-style-type: none">Forced flow.Represents an intersection failure condition that is caused by geometric and/or operational constraints external to the intersection.

Table C4: Level-of-Service Criteria for Unsignalized Intersections

Level of Service	Average Control Delay per Vehicle (Seconds)
A	<10.0
B	>10.0 and \leq 15.0
C	>15.0 and \leq 25.0
D	>25.0 and \leq 35.0
E	>35.0 and \leq 50.0
F	>50.0

It should be noted that the level-of-service criteria for unsignalized intersections are somewhat different than the criteria used for signalized intersections. The primary reason for this difference is that drivers expect different levels of performance from different kinds of transportation facilities. The expectation is that a signalized intersection is designed to carry higher traffic volumes than an unsignalized intersection. Additionally, there are a number of driver behavior considerations that combine to make delays at signalized intersections less galling than at unsignalized intersections. For example, drivers at signalized intersections are able to relax during the red interval, while drivers on the minor street approaches to TWSC intersections must remain attentive to the task of identifying acceptable gaps and

vehicle conflicts. Also, there is often much more variability in the amount of delay experienced by individual drivers at unsignalized intersections than signalized intersections. For these reasons, it is considered that the control delay threshold for any given level of service is less for an unsignalized intersection than for a signalized intersection. While overall intersection level of service is calculated for AWSC intersections, level of service is only calculated for the minor approaches and the major street left turn movements at TWSC intersections. No delay is assumed to the major street through movements. For TWSC intersections, the overall intersection level of service remains undefined: level of service is only calculated for each minor street lane.

In the performance evaluation of TWSC intersections, it is important to consider other measures of effectiveness (MOEs) in addition to delay, such as v/c ratios for individual movements, average queue lengths, and 95th-percentile queue lengths. By focusing on a single MOE for the worst movement only, such as delay for the minor-street left turn, users may make inappropriate traffic control decisions. The potential for making such inappropriate decisions is likely to be particularly pronounced when the HCM level-of-service thresholds are adopted as legal standards, as is the case in many public agencies.

Disclaimer: A higher number of crashes may be reported as of 2011 compared to prior years. This does not reflect an increase in annual crashes. The higher numbers result from a change to an internal departmental process that allows the Crash Analysis and Reporting Unit to add previously unavailable, non-fatal crash reports to the annual data file. Please be aware of this change when comparing pre-2011 crash statistics.
